

MATLAB EXPO

**Real-Time Prototyping and Testing for ADAS:
Lane Keeping and Following Assist Systems**

Abhisek Roy and Rashmi Gopala Rao

The Things You Will Learn

Virtual Vehicle

How do I perform
real-time virtual vehicle
simulation?

Controls

How can I rapidly
prototype and test
controls?

Camera
Perception

How do I test
perception and
controls?

Fast-Track from Desktop to Real-Time Simulation and Testing

Turnkey Solution from MathWorks and Speedgoat

Create, deploy, monitor and
instrument real-time applications

Outline

Part 1

How do I test
perception and
controls?

Real-Time Virtual Vehicle Simulation

Part 1

Virtual
Simulation

How do I perform
real-time virtual vehicle
simulation?

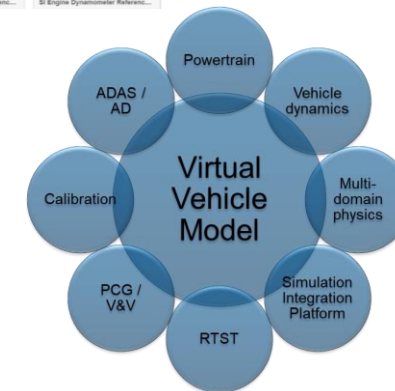

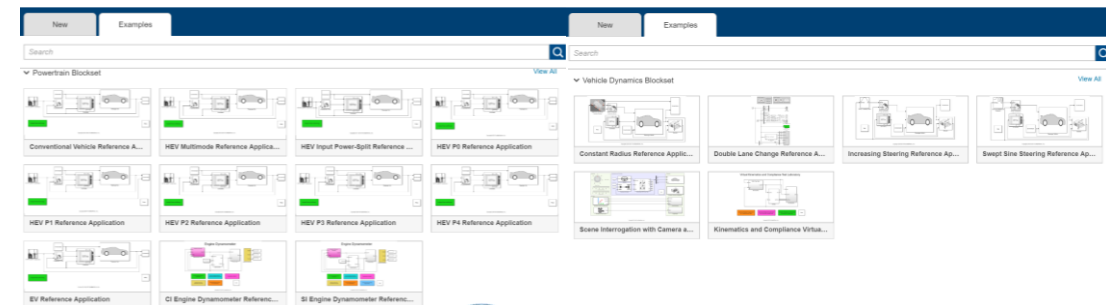

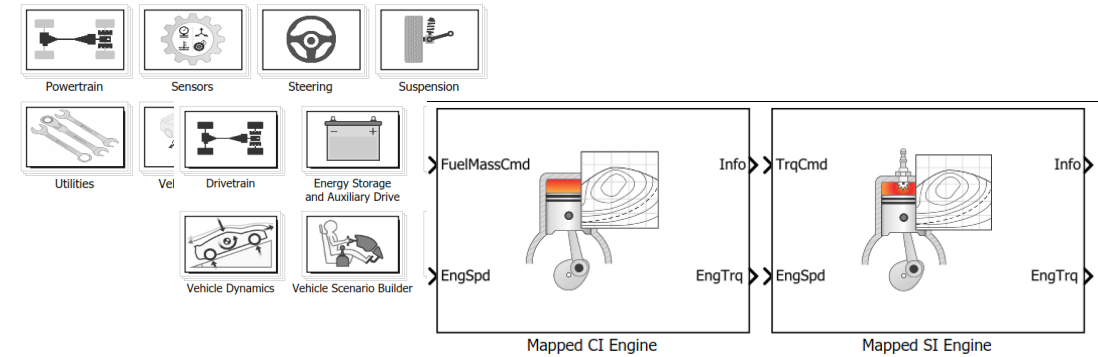

Need for Virtual Vehicle Simulation & Testing

- Prototypes are expensive
- Logistics and safety
- Early validation
- Development accelerator
- Synthesize edge scenarios
- Test handoff, platooning
- Repeatability, reproducibility
- Qualified miles

Virtual Vehicle Simulation

- Common challenges:
 - Solutions are expensive and cumbersome
 - Poor Simulink integration
 - Solutions geared towards experts
- Strengths of MathWorks solution:
 - Extensively supported
 - Open, customization possible
 - Integrated, flexible and well connected
 - **Fast, ready for Hardware-in-the-Loop deployment**

Virtual Vehicle: Desktop Simulation

Example: Double-Lane Change Maneuver

- *Vehicle Dynamics Blockset™*

Ride & Handling

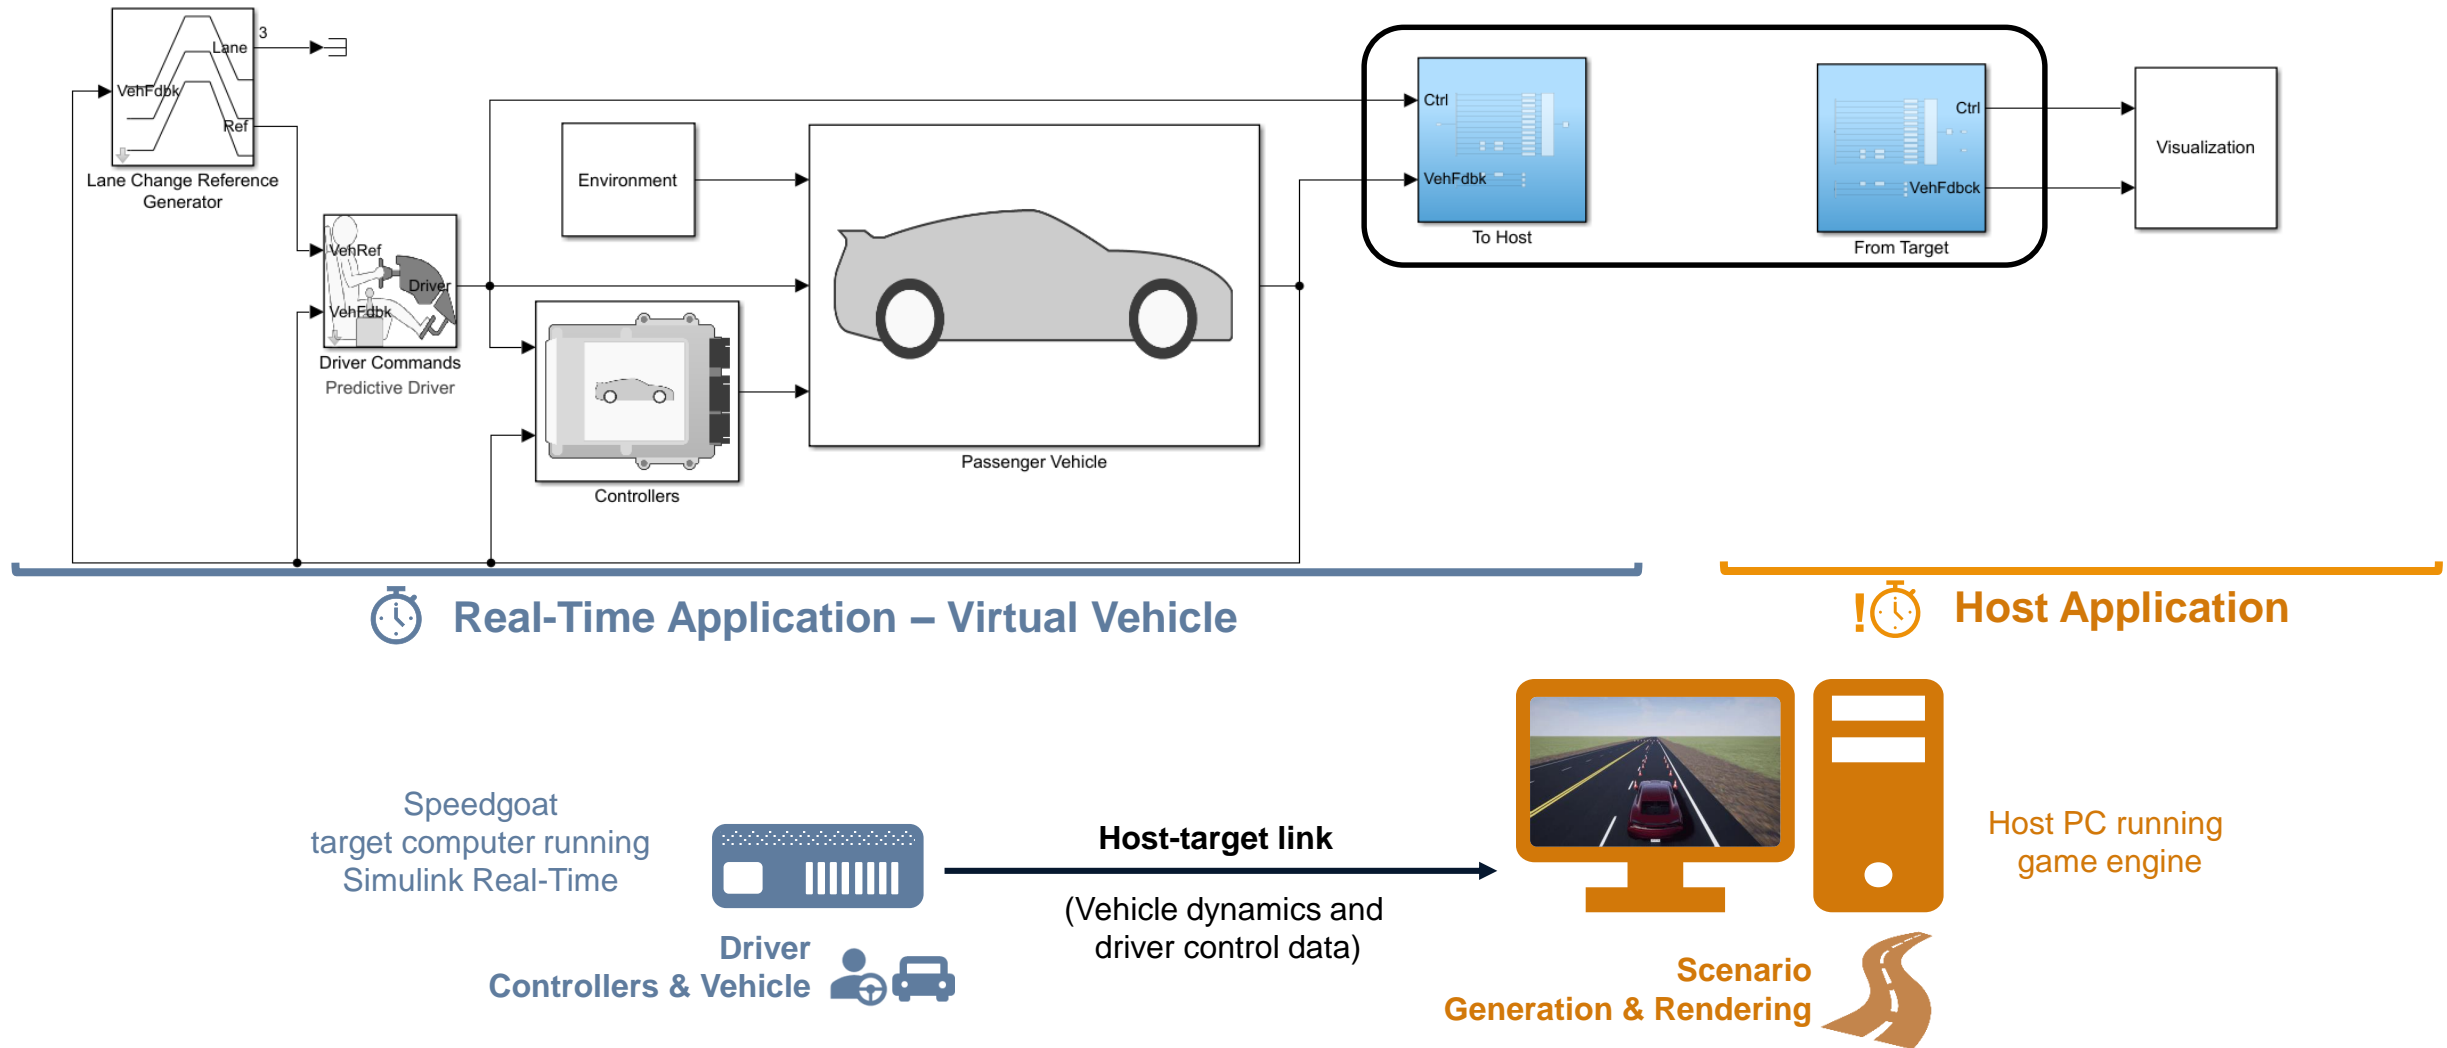

Chassis Controls

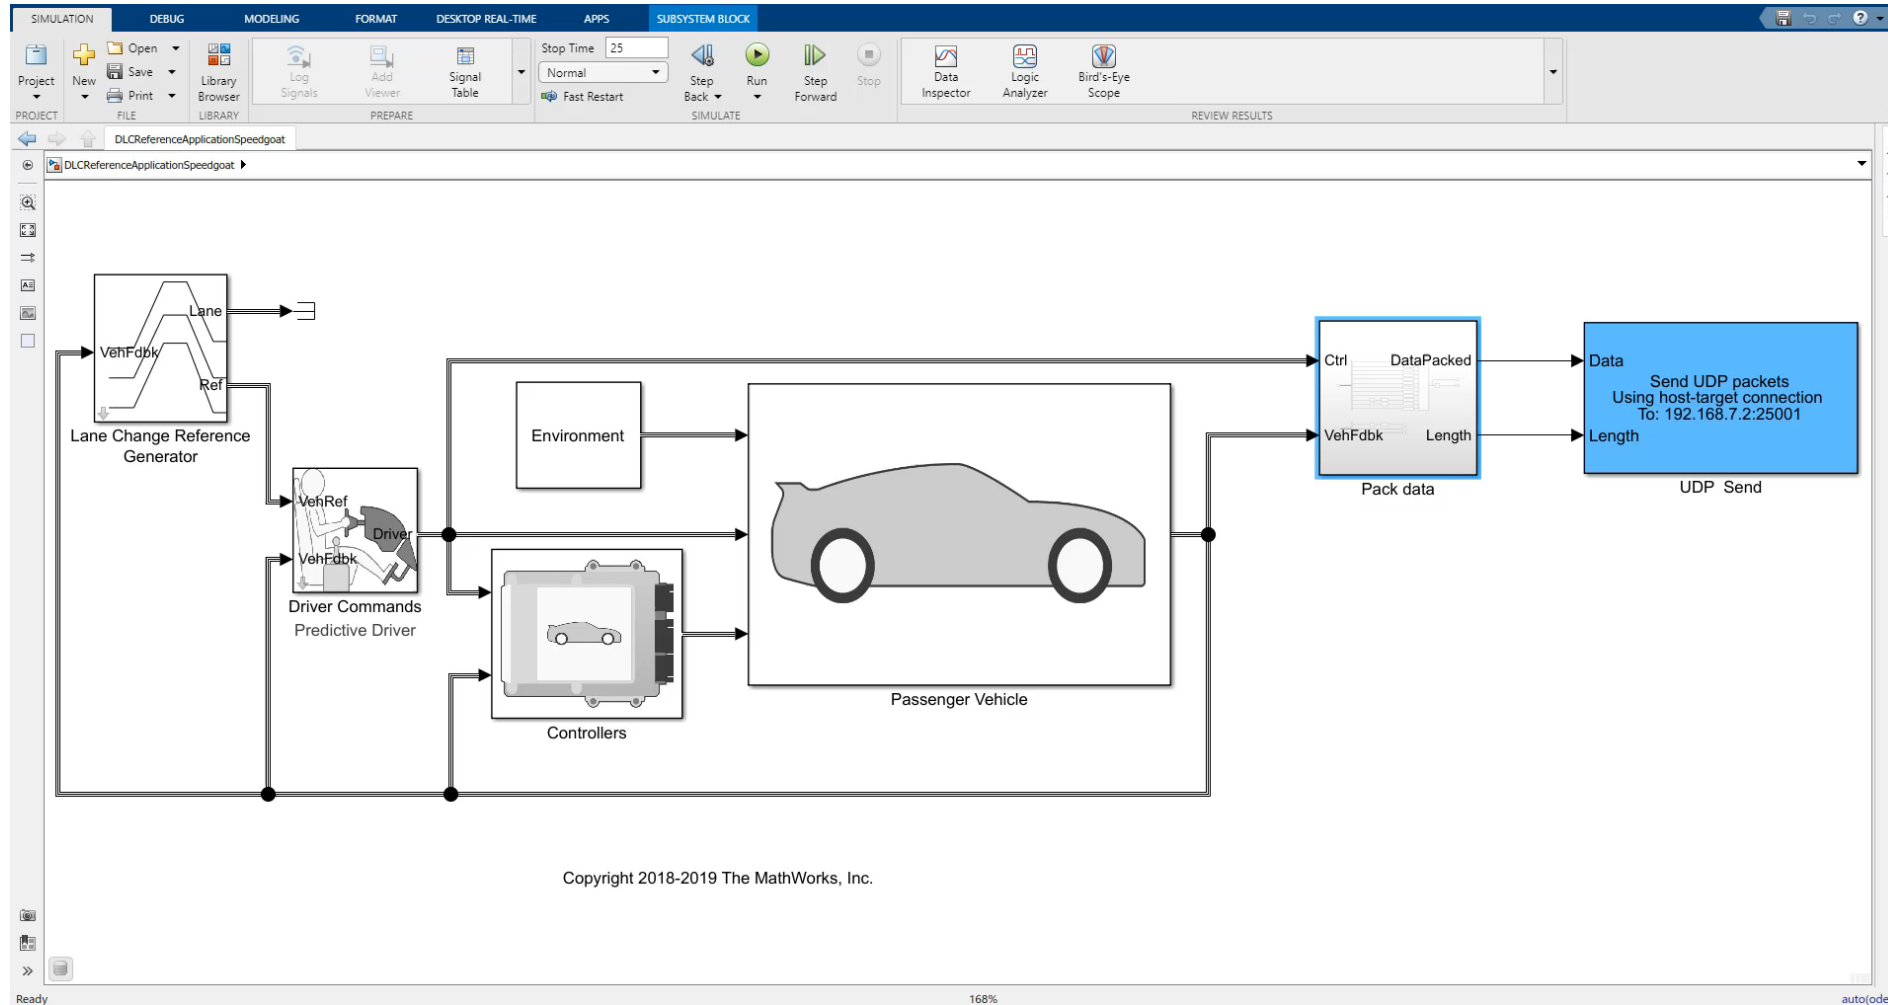

ADAS / AD

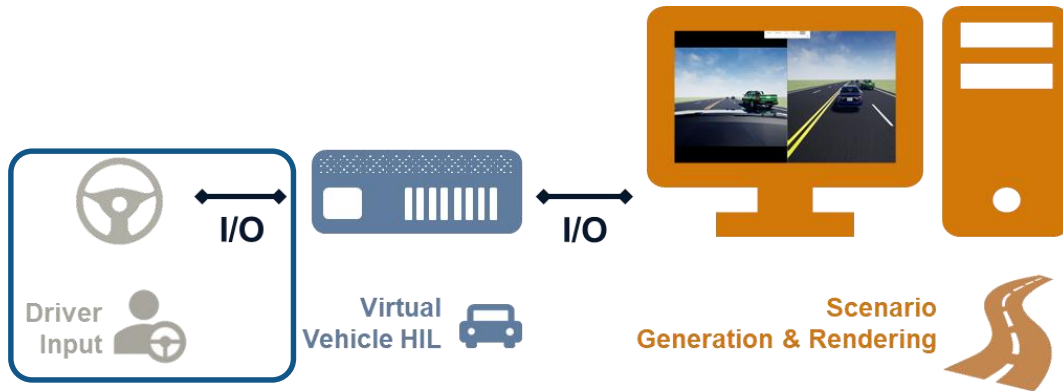

Virtual Vehicle: From Desktop to Real-Time Simulation

Virtual Vehicle: From Desktop to Real-Time Simulation

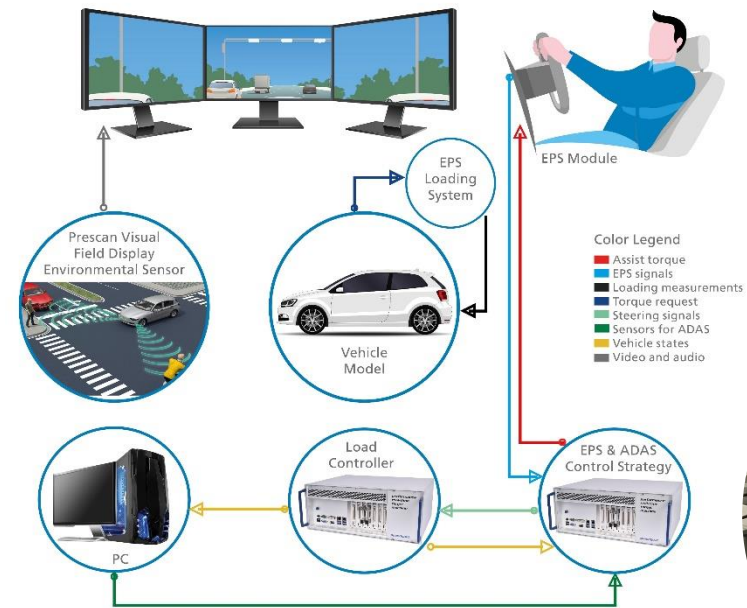

Real-Time Driver-in-the-Loop (DIL) Simulator

Webinar: Building Real-Time DIL Simulators

Success story: Tongji University

"The Speedgoat system works well with many of the tools in MATLAB. It is a very efficient way to construct the test platform so that we can concentrate on the development of the ADAS algorithm."

Professor Hui Chen, Tongji University

Part 2: Real-Time Prototype and Test Lane Keeping Controller

Part 2

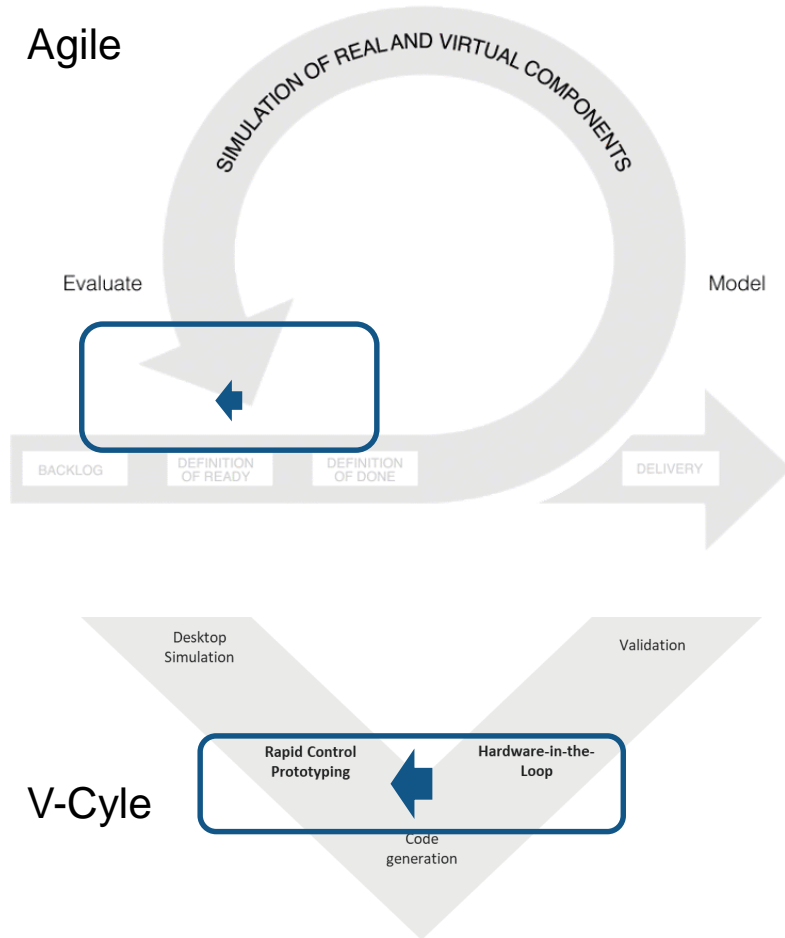

Controls +
Virtual Vehicle

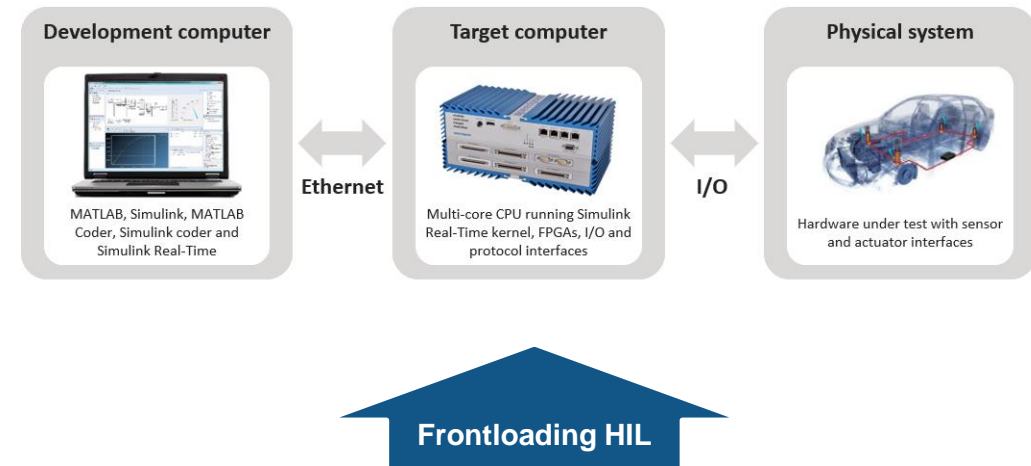

How can I rapidly
prototype and test
controls?

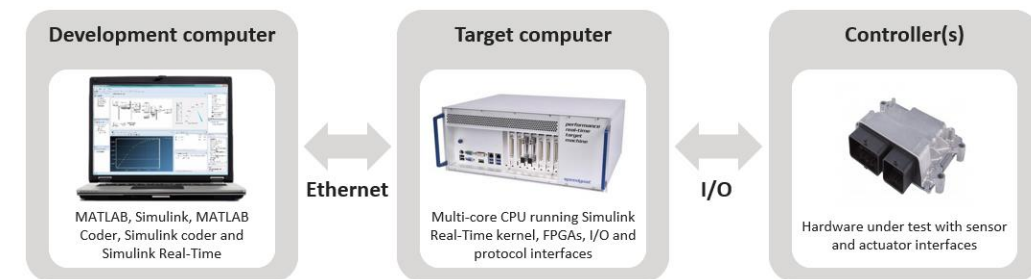

Expediting Development by Frontloading Virtual Vehicle HIL

Rapid Control Prototyping

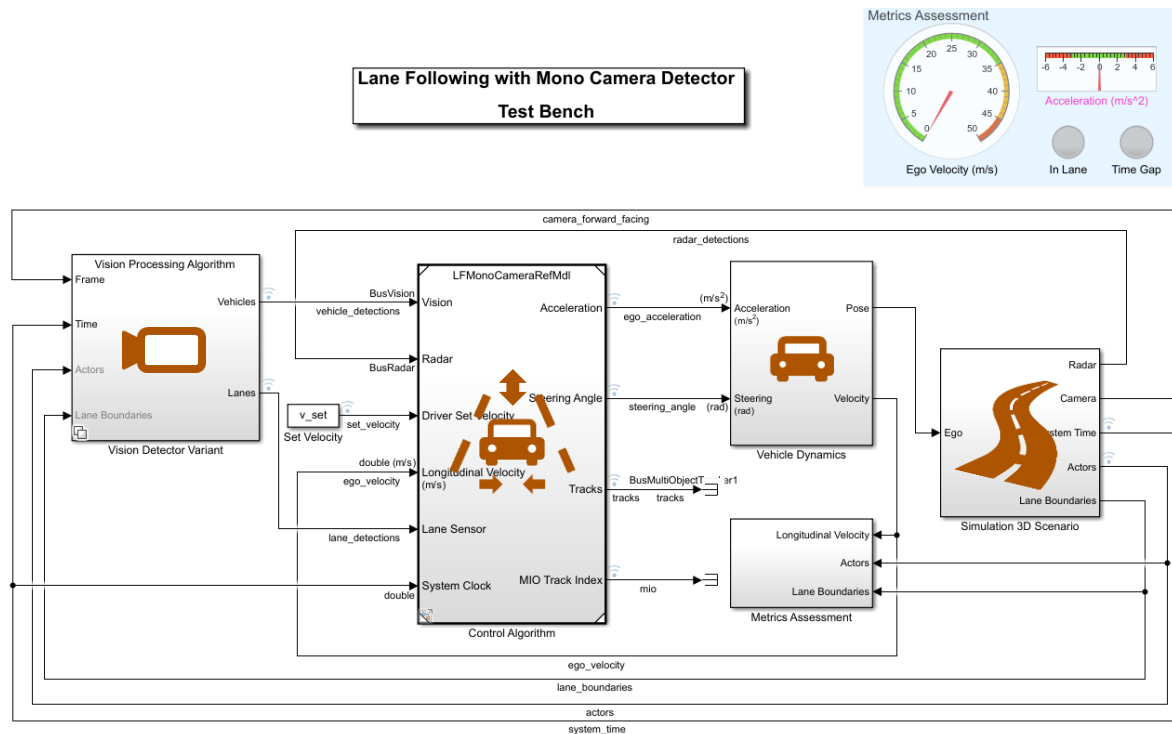

Hardware-in-the-Loop

Lane Keeping Control with Model Predictive Control

Example: Lane-Following Control with Monocular Camera Perception

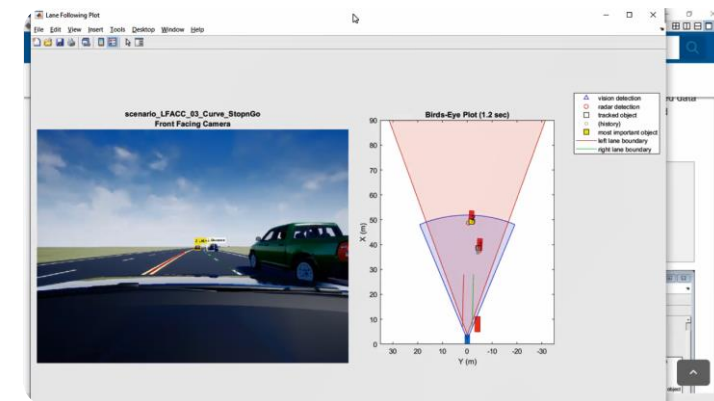

- Automated Driving Toolbox™
- Model Predictive Control Toolbox™
- Simulink Control Design™

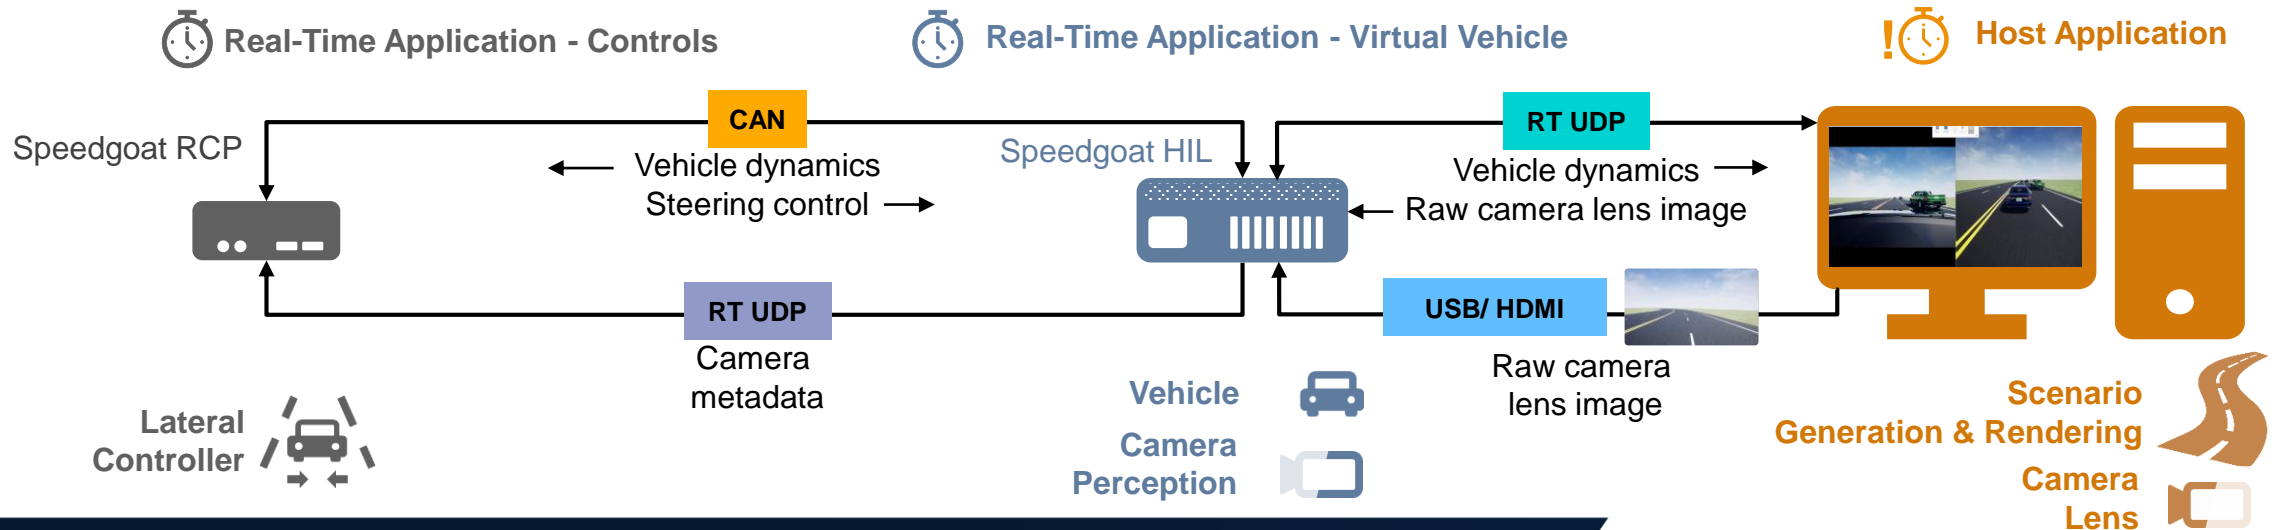

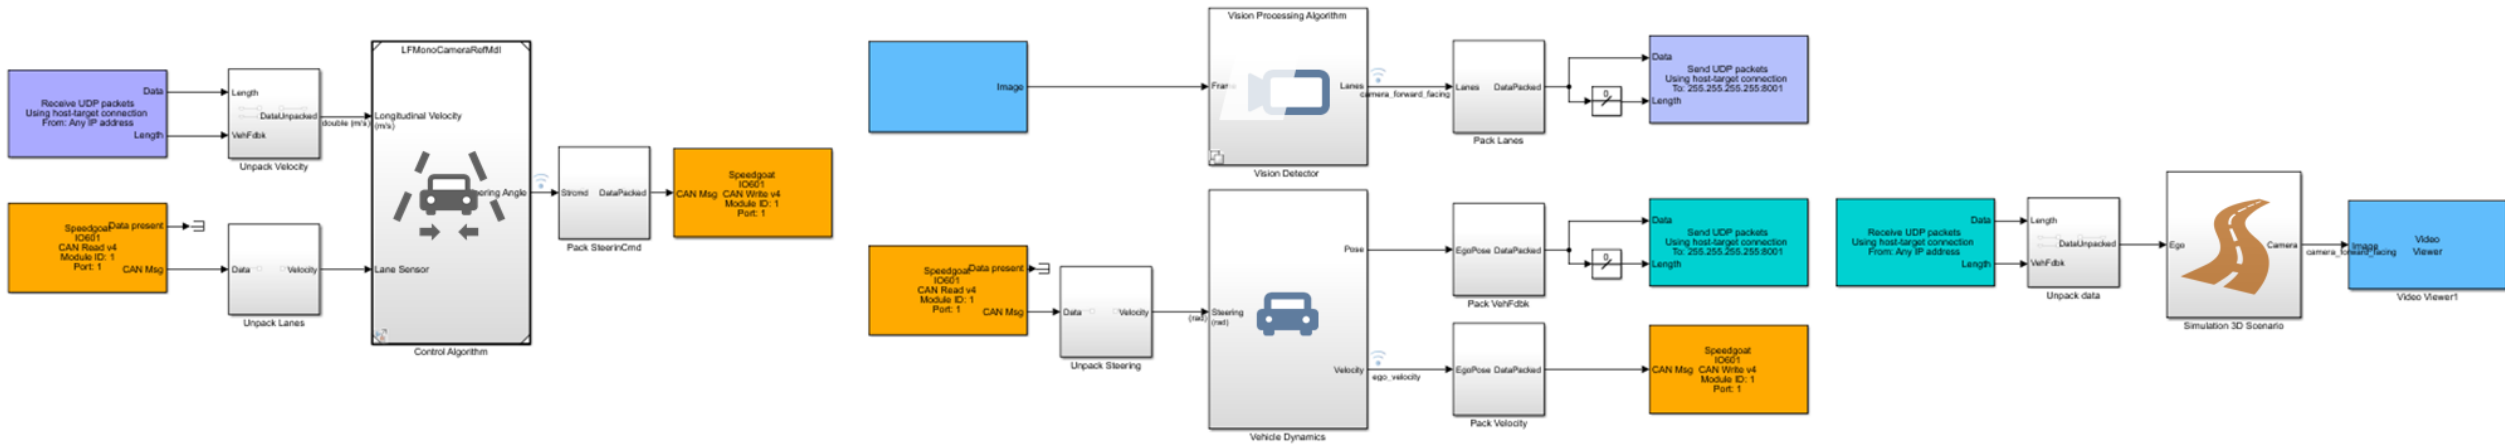

Simulate controls with perception

Visualize logged simulations

Lane Keeping Control Real-Time Test Bench

Lane Keeping Control Real-Time Testbench

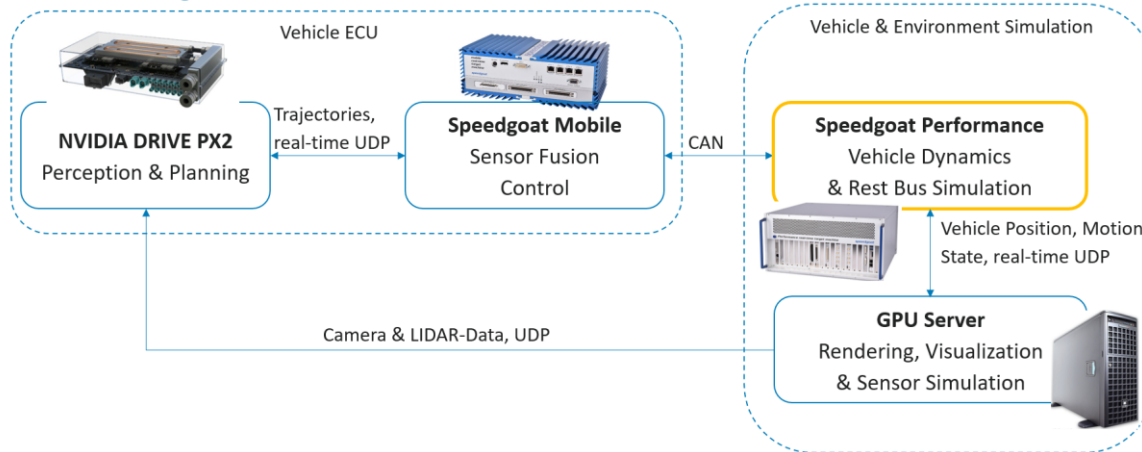

Lane Keeping Control Real-Time Test Bench

Customer Success Story: TUM / Roborace

Code Integration Workflow - HiL

MathWorks Automotive Conference 2019, Stuttgart

24

HiL @ TUM

“The seamless integrated workflow provided by Speedgoat and Simulink Real-Time™ really helped us to minimize the time we had to invest building this HiL simulator and maximized the time we could spend developing the functionalities of our algorithms.”

Thomas Herrmann, TUM RoboraceTeam

[MathWorks Automotive Conference 2019](#)

Automate Testing in Real-time

Example: Testing a Lane Following Controller with Simulink Test

The screenshot shows the MATLAB Test Manager interface. On the left, a tree view under 'Scenarios' lists various test cases, with 'ACC_ISO_TargetDiscriminationTest' selected. A callout box labeled 'Scenarios' points to this list. The main pane shows the configuration for 'ACC_ISO_TargetDiscriminationTest'. It includes a 'REQUIREMENTS*' section with a link to 'scenarioId #1: ACC_ISO_TargetDiscriminationTest (LaneFollowingTestRequirements#1)'. A callout box labeled 'Requirements link' points to this link. Below, the 'SYSTEM UNDER TEST*' section shows the 'Model' set to 'LaneFollowingTestBenchExample'. A callout box labeled 'Simulink Model' points to this field. The 'PRE-LOAD*' section contains a script: '1 scenarioId = 1; 2 helperLFSetup;'. A callout box labeled 'Define scenario ID and data initialization' points to this script. At the bottom, a 'Requirement' callout box points to a table of test results.

Test Description	Host car	Lead car	Third car
Target Discrimination Test	initial velocity = 30m/s	constant accel 24m/s → 27m/s @ 2m/s²	24m/s
	HWT = 2.2sec (HW = 66m)	V _{lead} = 27m/s (97.2kph)	
	v _{set} = 30m/s

Virtual Vehicle

How do I test
perception and
controls?

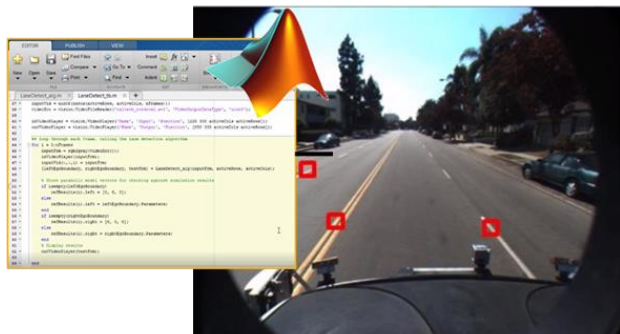

Modern Vision Applications Often Require FPGA Acceleration

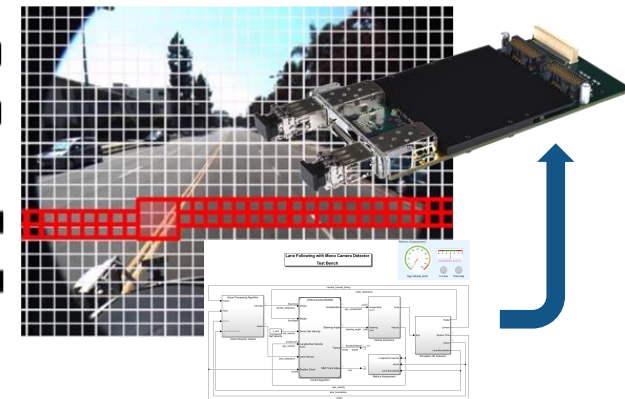

- Lane detection is a critical processing stage in ADAS
- Computational expensive
- Acceleration needed, e.g., on FPGAs

Concept and Algorithm Development

Prototyping, architecture and chip design

Bridging the Gap between Exploration and Deployment

Video series: Vision Processing for FPGA

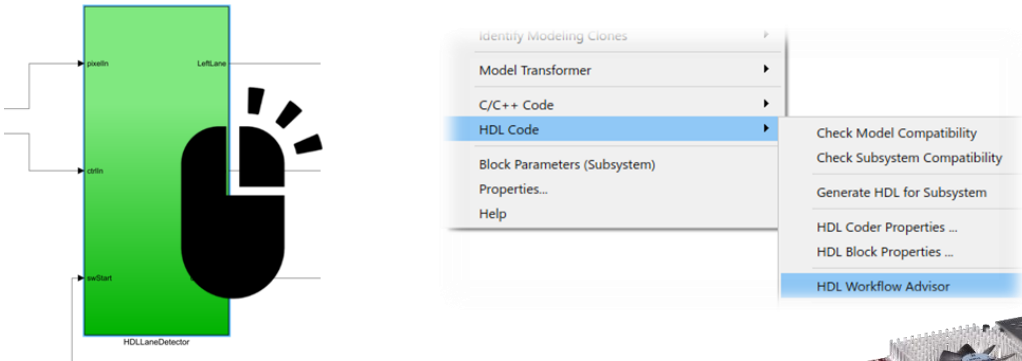

Vision Processing for FPGA

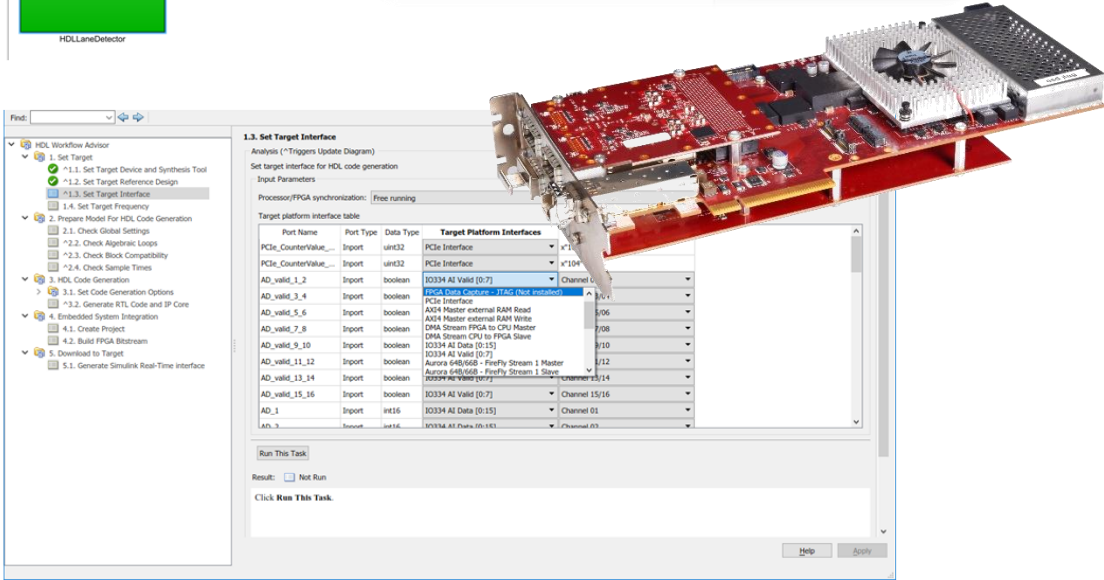

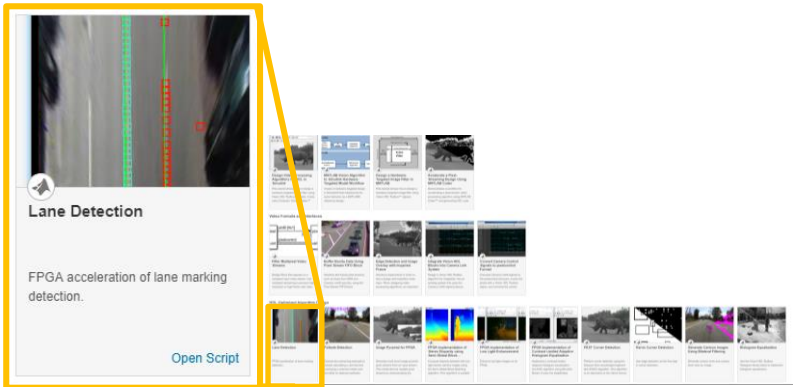

Watch this five-part video series that introduces key concepts and the workflow for targeting vision applications to FPGAs for prototyping and production.
