

MATLAB EXPO 2022

Autonomous Co-working Robot Development with Multimodal Control based on Model-Based Design

Kazuki Ono

May, 2022

Agenda

1. Introduction
2. Software Development Kit(SDK) for Robot-Hand Control System
3. Overview of Robot-Hand Development using Model-Based Design(MBD) and MATLAB® Tools
4. Construction of Controllable Multimodal Robot System
5. Impression and Conclusion

1. Introduction

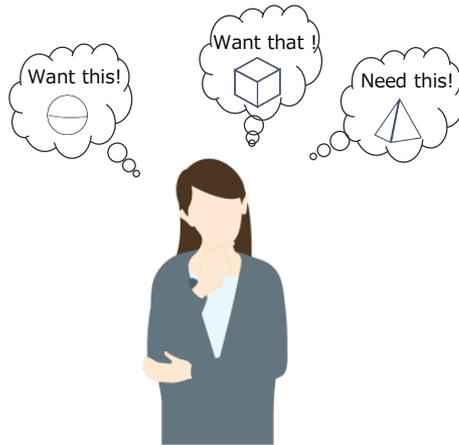

1.1 Initiatives for Multimodal Autonomous Co-working Robot System

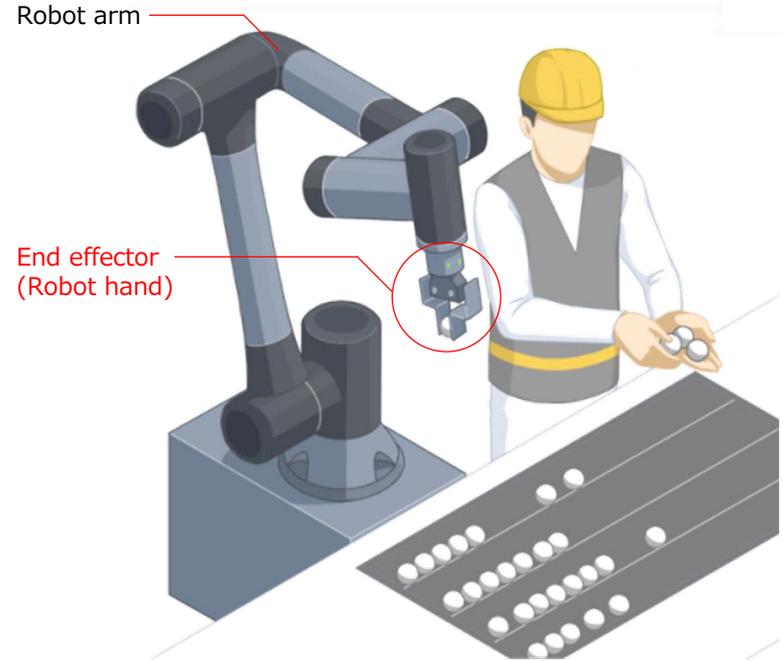

1.2 Background of Co-working Robot Applications

Social Challenges:

- + Shrinking workforce caused by aging and declining population
- + Diverse customer demands

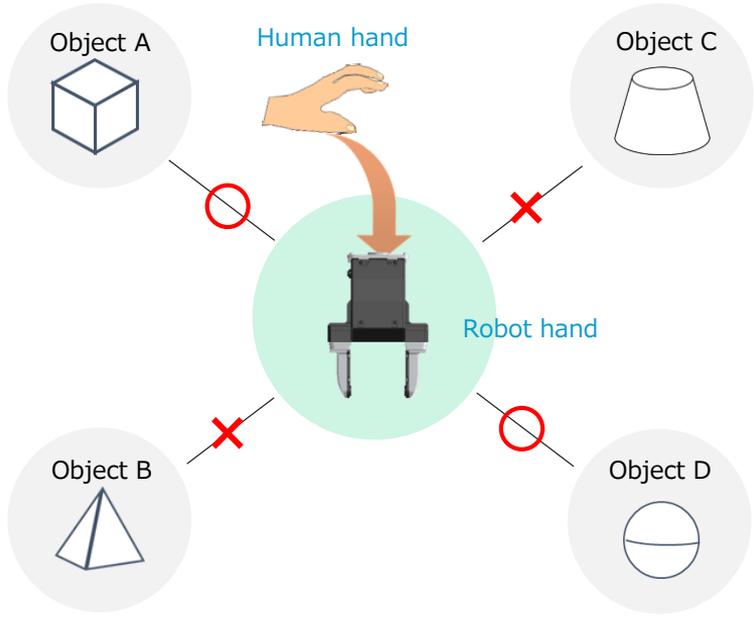

Co-working Robot with Multimodal Control System

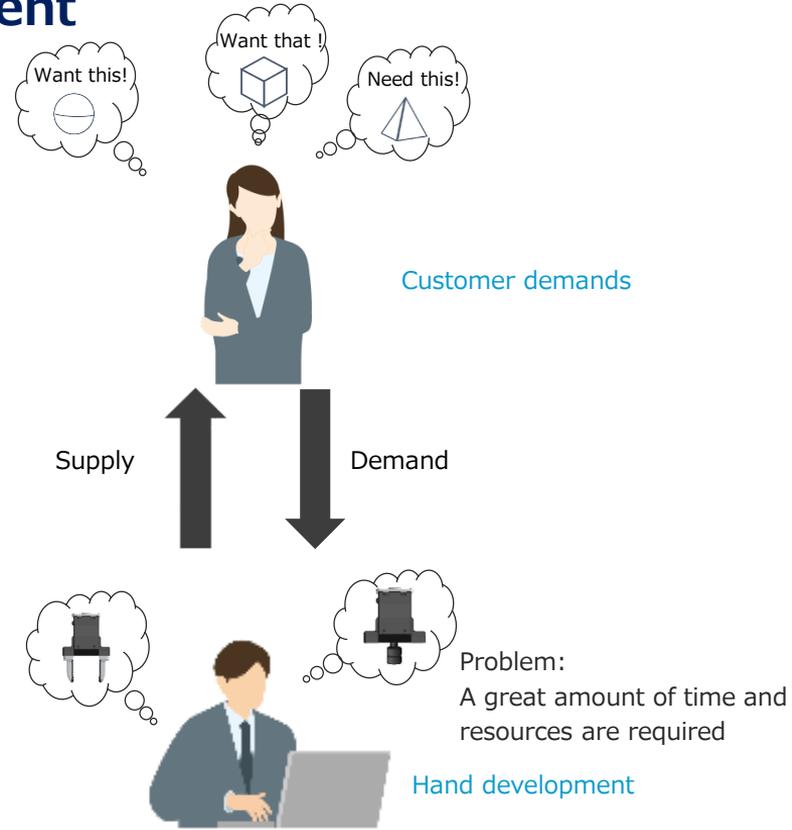

Choosing an end effector is critical to manage multiple and diverse customer demands

1.3 Background of Robot Hand Development

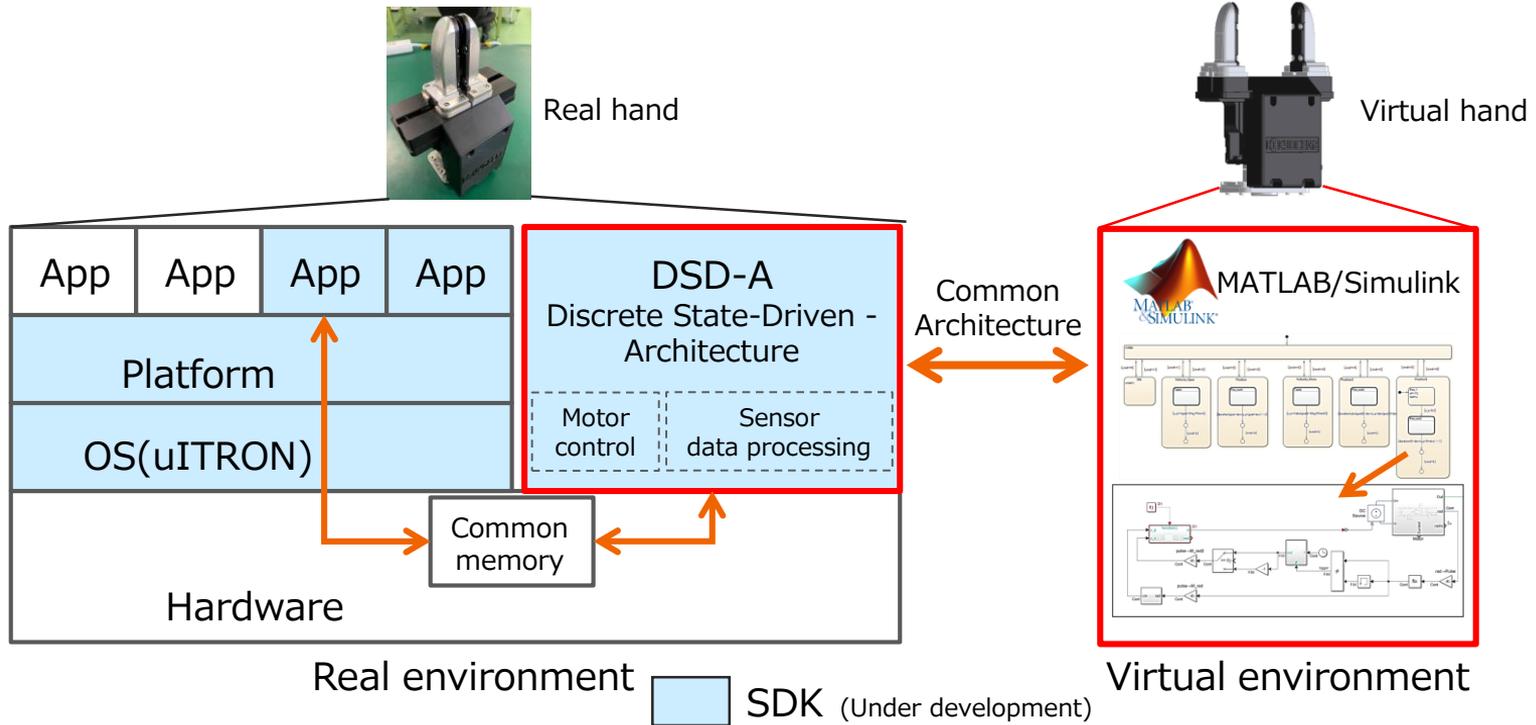

No practical application of a general-purpose hand that can replace human hand to perform any task. Generally, robot hand development is required for each specific task.

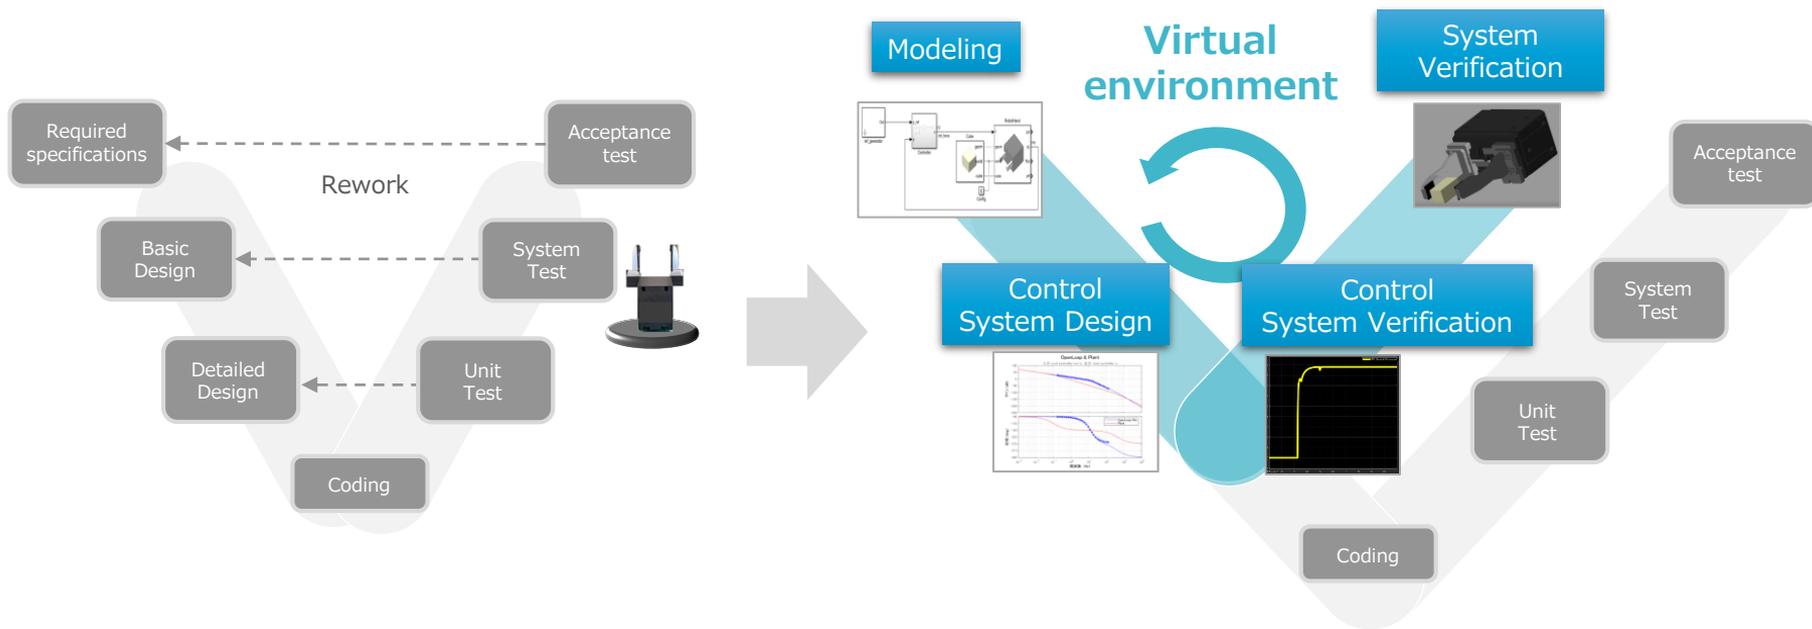

Rapid robot hand development system is necessary to satisfy diverse customer demands

1.4 Our proposal : Software Dev. Kit (SDK) for Robot Hand Control System

By using our proposed SDK, we believe that we will be able to develop this robot hand systems efficiently and respond quickly to diverse customer demands.

1.5 About Model-Based Design(MBD)

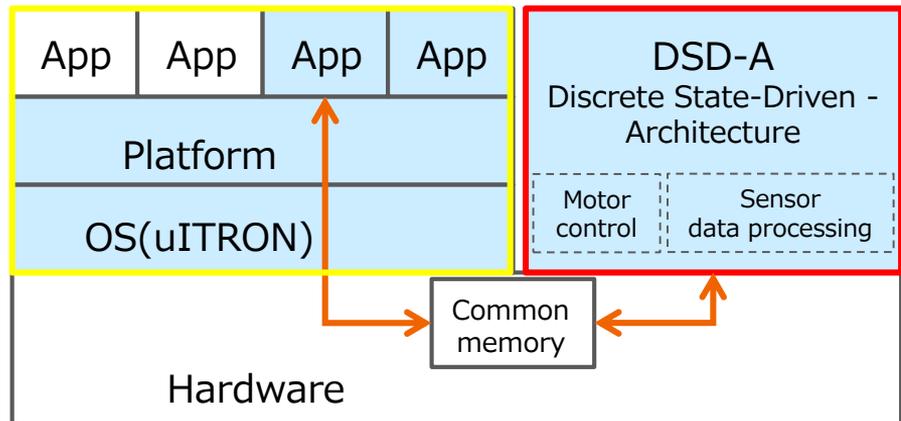

+ By using MBD, front-loading the designing process can be done which then improves the design quality.

+ Also, robustness can be estimated by considering variations and noise in virtual environment.

Since there will be less "Rework" than before, development costs and resources can also be cut down.

2. Software Development Kit(SDK) for Robot Hand Control System

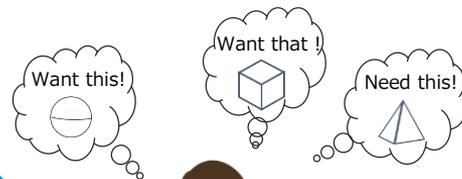

2.1 Features of SDK for Robot Hand Development

Real environment

 SDK (Under development)

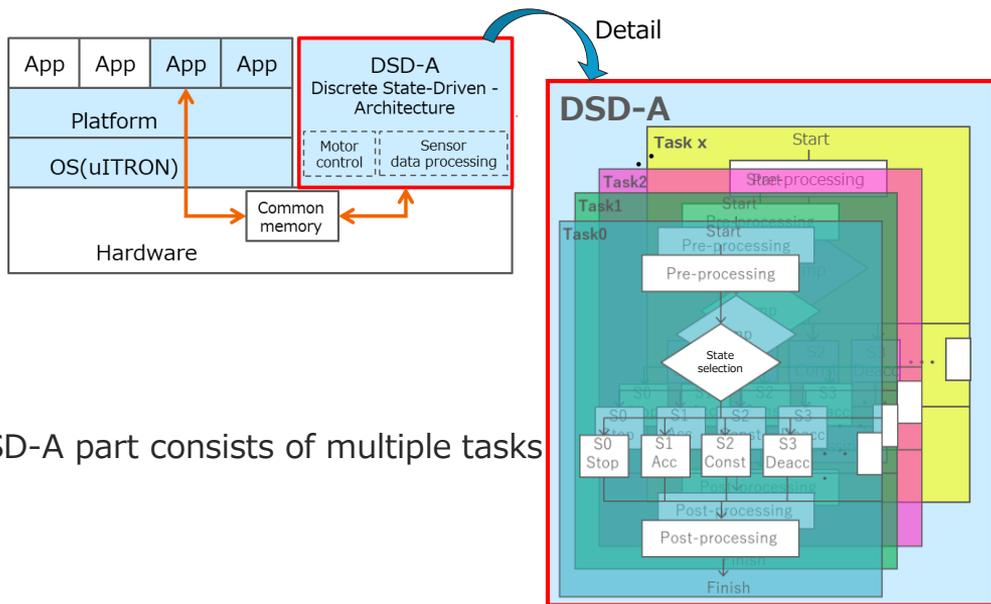

- + The SDK is divided into DSD-A part, which performs sensor processing and controls actuators such as motors, and OS part, which manages other applications.
- + The DSD-A and OS parts exchange information via common memory.
- + DSD-A part handles the design of control software related to the hardware configuration, such as the type of sensors or motor control, used and modified according to customer needs.

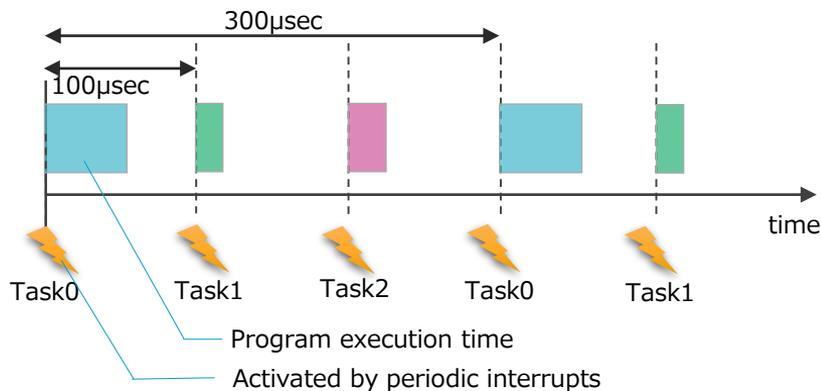

Customer demands

2.3 Features of Discrete State Driven-Architecture (DSD-A)

-Task Definitions and Discrete Periodic Processing

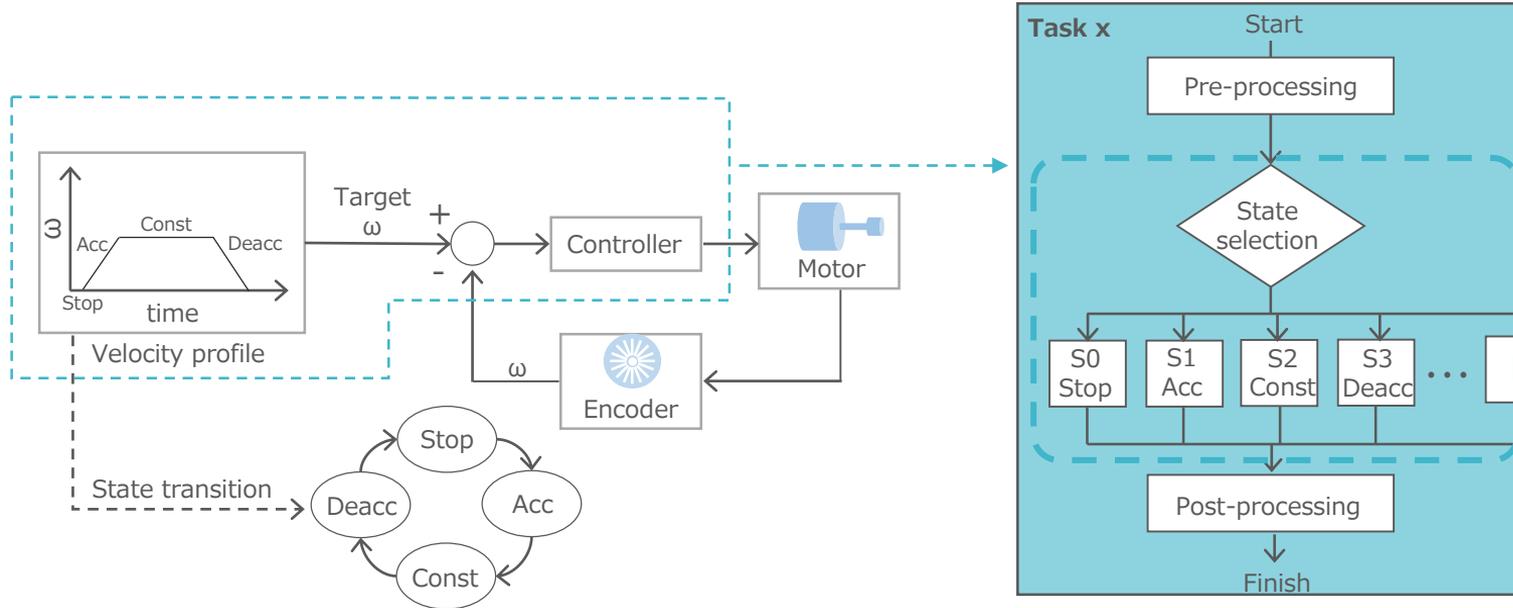

(E.g.) Case of three task

- + The sensors and actuators mounted on the robot hand are defined as task. For example, Actuator 1 is defined as Task 0, Sensor 1 as Task 1, Sensor 2 as Task 2, etc.
- + Each task is activated by periodic interrupts

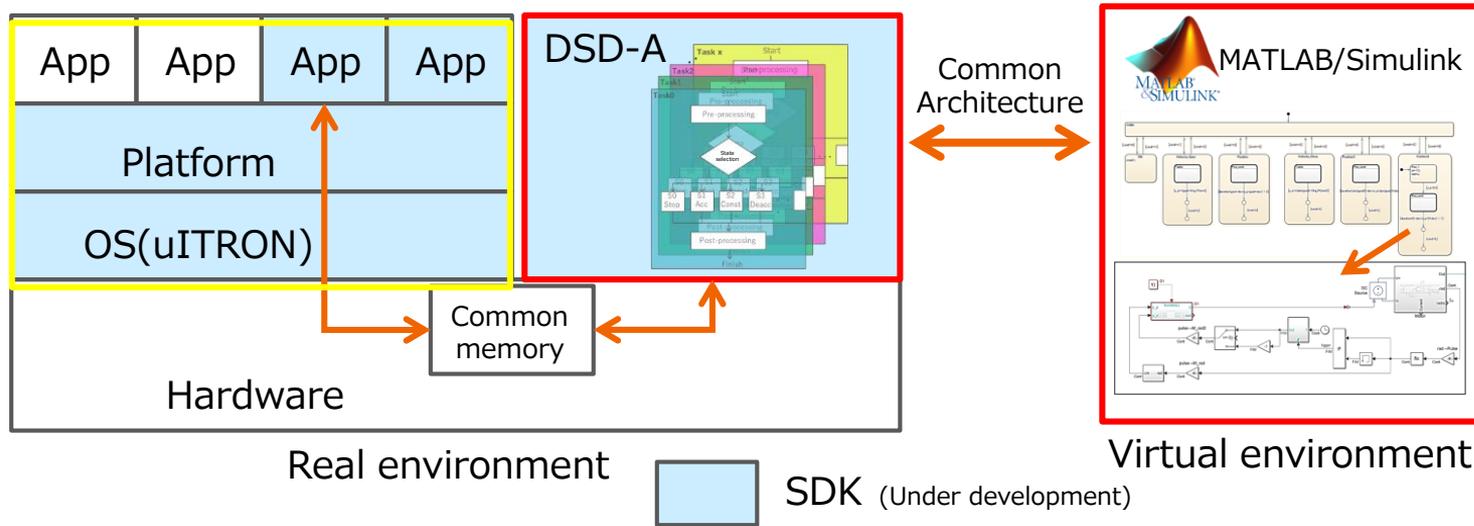

2.4 Features of Discrete State Driven-Architecture (DSD-A)

-State-Driven Control and Real-Time Assurance

+ The program is divided for each possible state of the actuators and sensor. Also, as the status transition from one to another periodically, the processing time of the program can be controlled, thus real-time processing can be assured.

2.5 Summary of SDK and DSD-A for Robot Hand Development

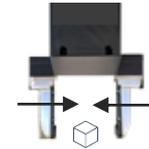

- + By using our proposed SDK, we believe that we will be able to develop this robot hand systems efficiently. Also, since DSD-A has common architecture in both real and virtual environments, it is possible to seamlessly implement the content designed in the virtual environment on to microcomputer.
- + With DSD-A, real-time processing can be assured.

3. Overview of Robot-Hand Development using Model-Based Design (MBD) and MATLAB® Tools

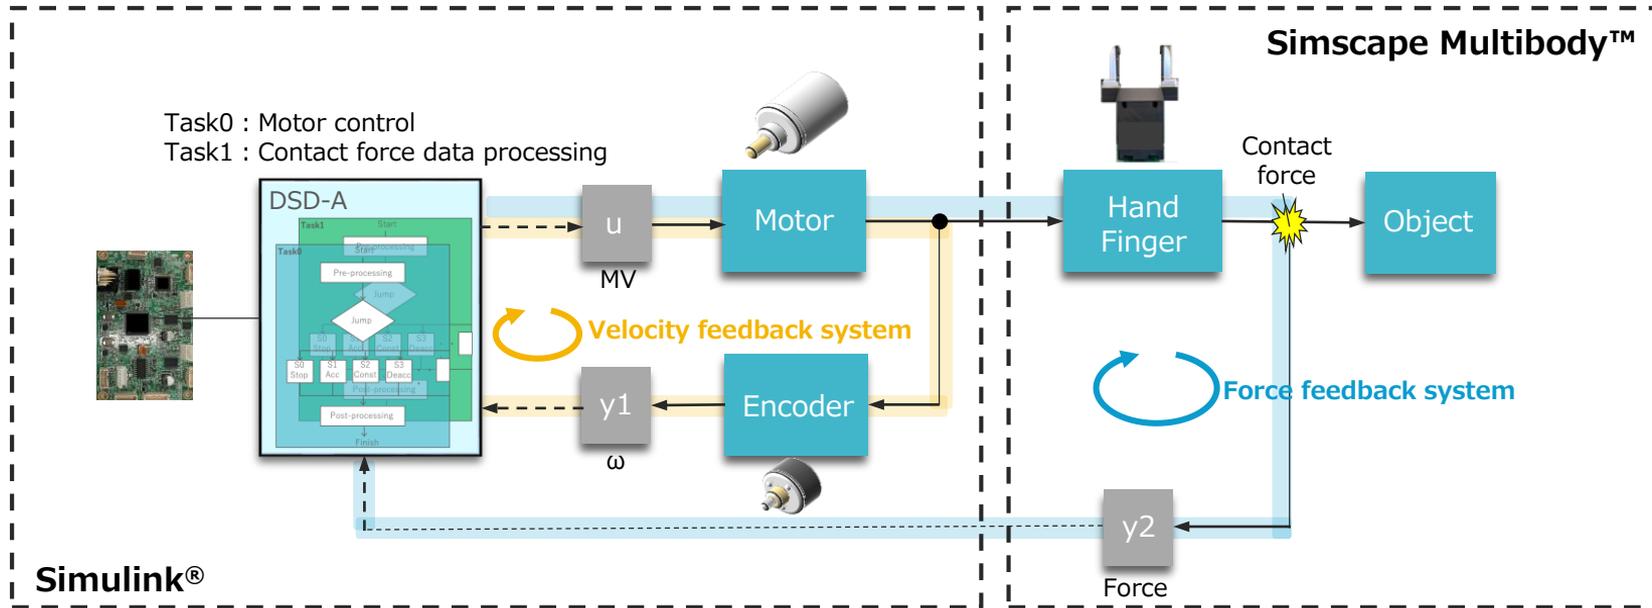

3.1 Robot Hand System Block Configuration

Robot Hand System

Robot hand system that enables stroke-width control of parallel-chuck robot finger by acquiring real-time information of velocity and contact force.

Parallel-chuck hand

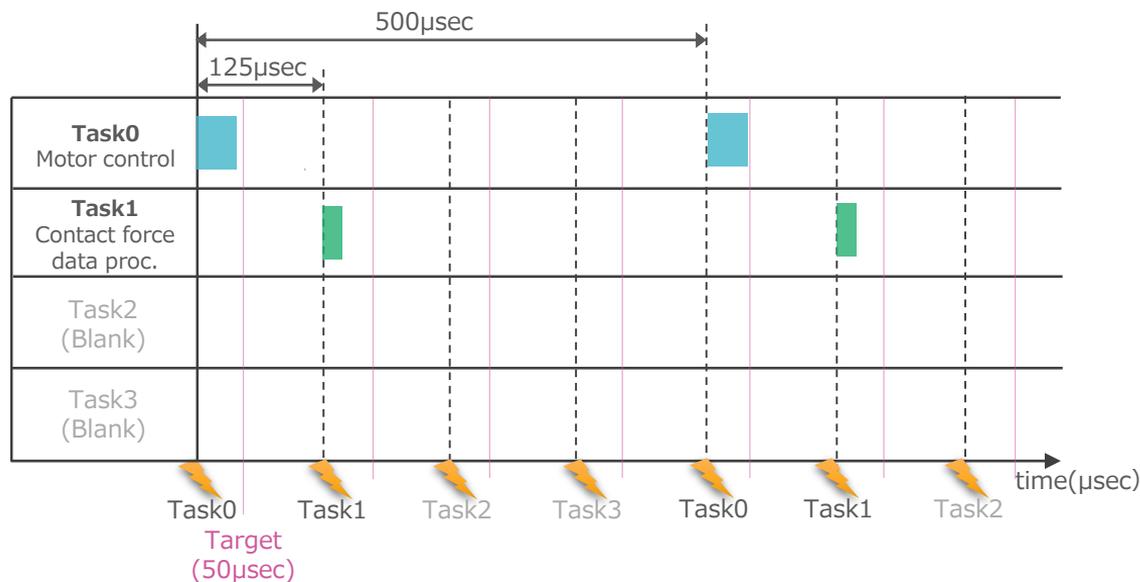

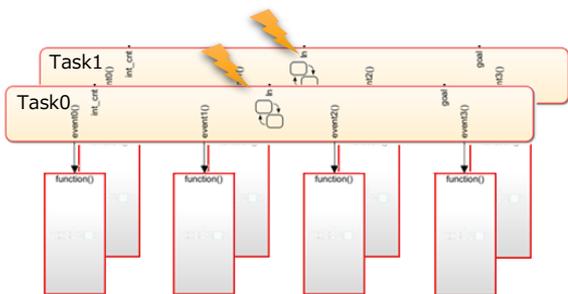

3.3 DSD-A Design -Target Setting-

Target setting of control cycle and processing time

DSD-A Design Items:

(Example)

- Control cycle : 500 μ sec
- Target processing time : 50 μ sec
- Processing time interval : 125 μ sec

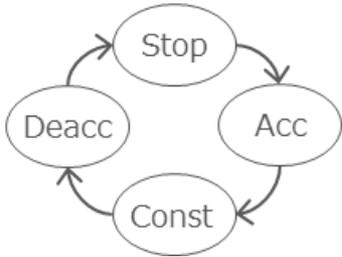

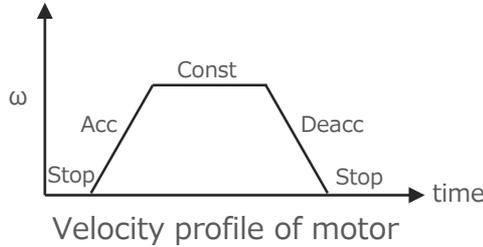

(⚡ : Execution timing)

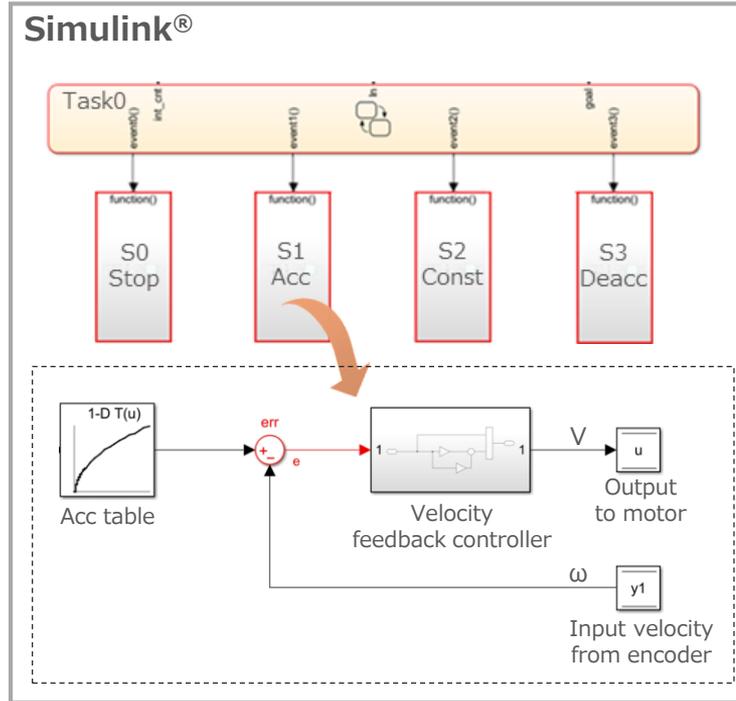

3.4 DSD-A Design –Assigning States–

Assigning states to motor control

Ex.
Case of velocity feedback control

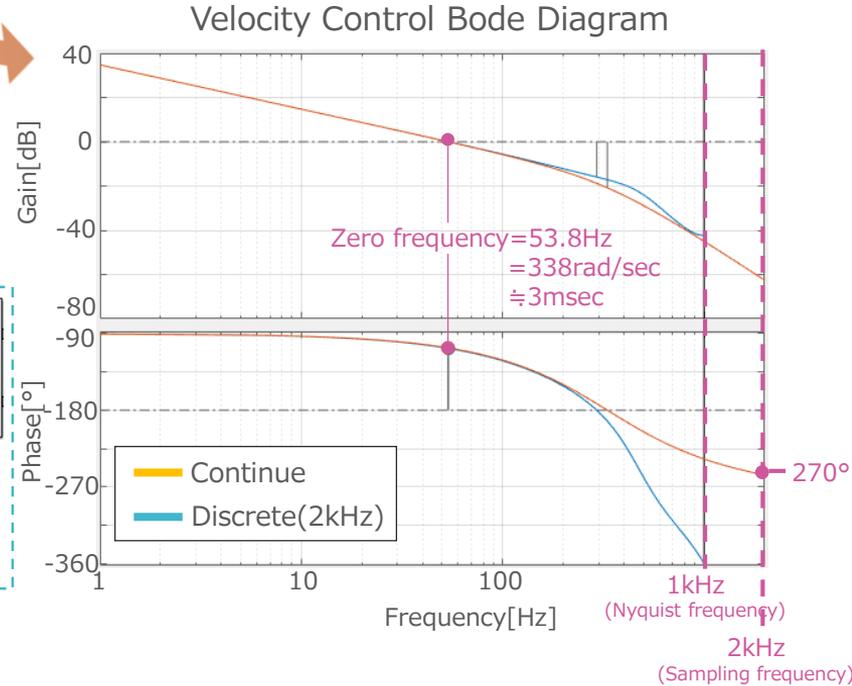

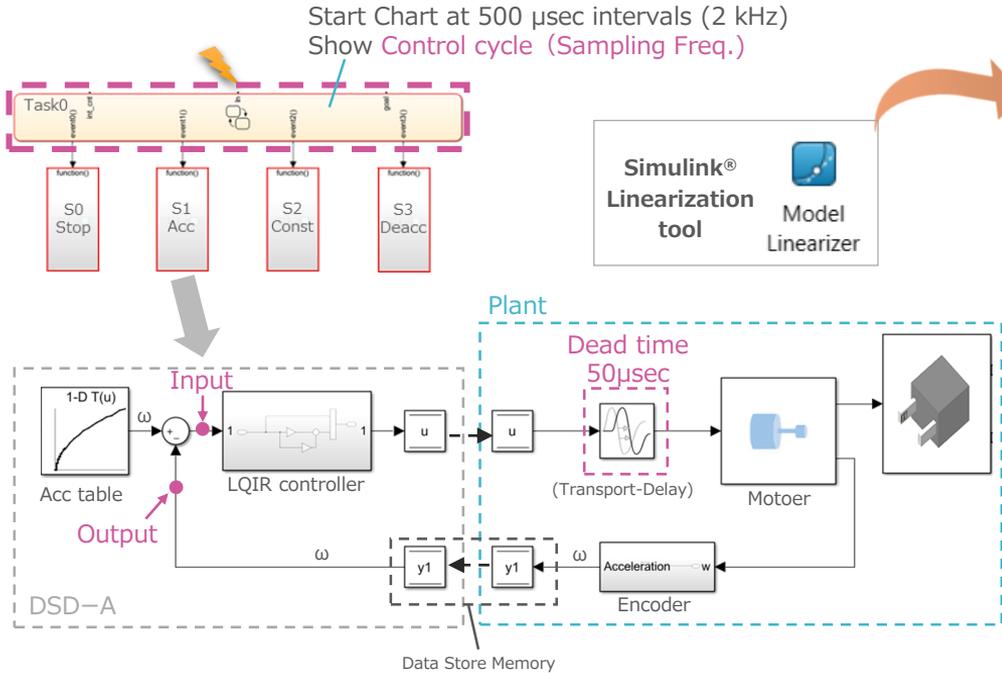

Ref: Motor velocity control state transition

Assign states to DSD-A based on state transitions

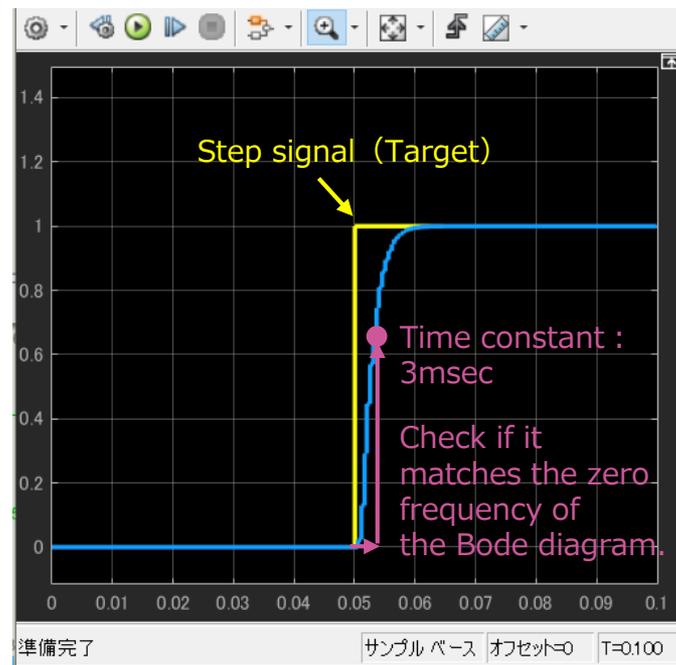

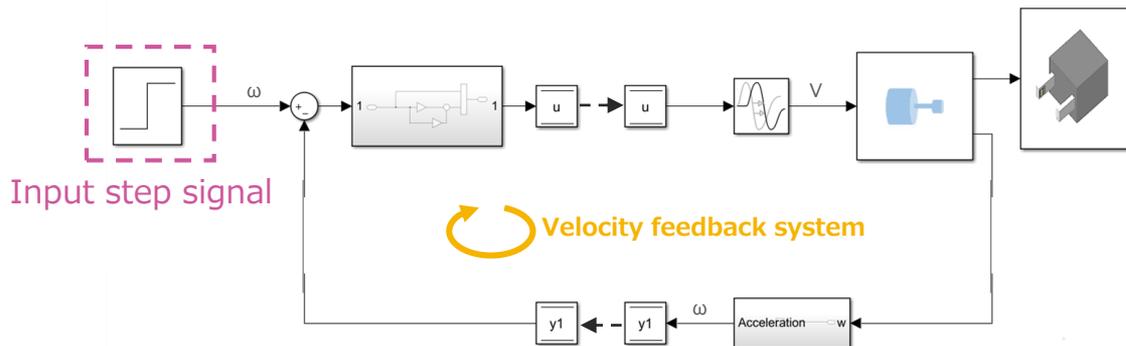

Assign Task 1 (Contact Force Data Processing)

3.5 DSD-A Design -Velocity feedback controller design-

- + Design the control system with DSD-A
- + The control system can be designed to include sampling frequency and dead time
- + Use Simulink Linear Analysis tools to easily generate Bode diagram

3.6 Verification - Velocity control system

Verification of speed control step response

3.7 Visualization of System Dynamics -Velocity control system-

Velocity scope

The screenshot displays the MATLAB R2020a environment. On the left, a 'Velocity scope' plot shows a graph with a y-axis labeled 'Velocity' and a scale of $\times 10^5$. The x-axis represents time from 0 to 2. The plot area is currently empty. Below the plot is the Simulink control panel, which includes simulation controls like 'Step Back', 'Pause', 'Step Forward', and 'Stop'. A 'Model Browser' on the left side shows a red-bordered panel for 'Handmodel21' with the following parameters:

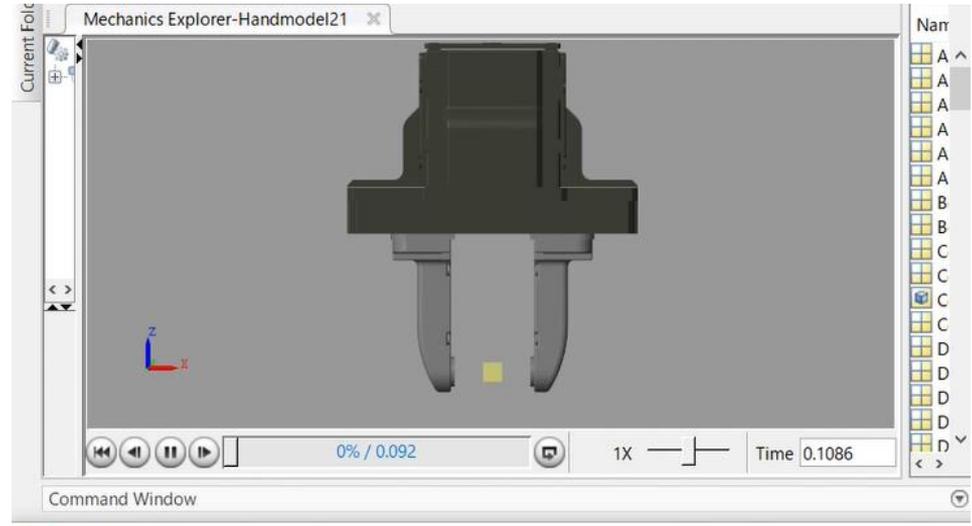

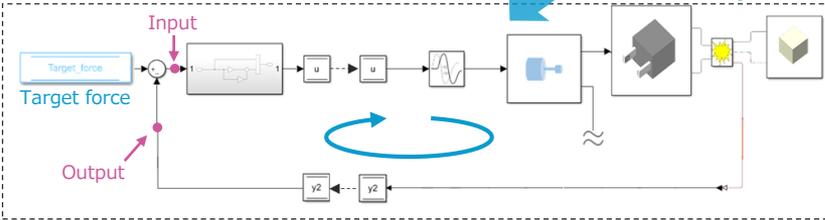

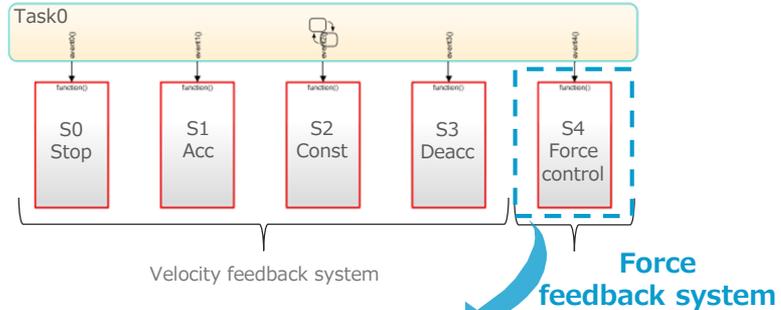

Target position(mm)	Object weight(g)	Command
40	100	
Target force(N)	Spring(N/m)	Moving
5	224428	Grasping
On:Down Off:UP	On: Off:Axis free Off:Axis lock	

At the bottom of the interface, a 3D model of a mechanical assembly is shown in the 'Mechanics Explorer' window. The assembly is a dark grey, cylindrical component with a central shaft. The simulation is running at 0% / 2.026 seconds.

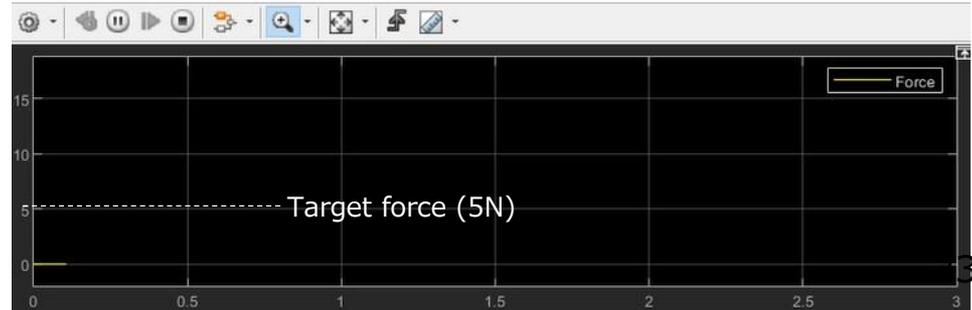

+ Simscape Multibody enables visualization of system dynamics

+ Dashboard Blocks library enables model manipulation and modification during simulation

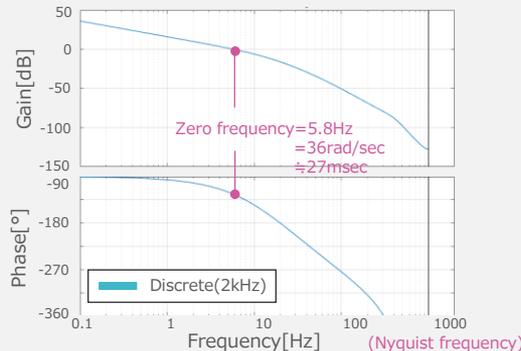

3.8 Visualization of System Dynamics -Force control system-

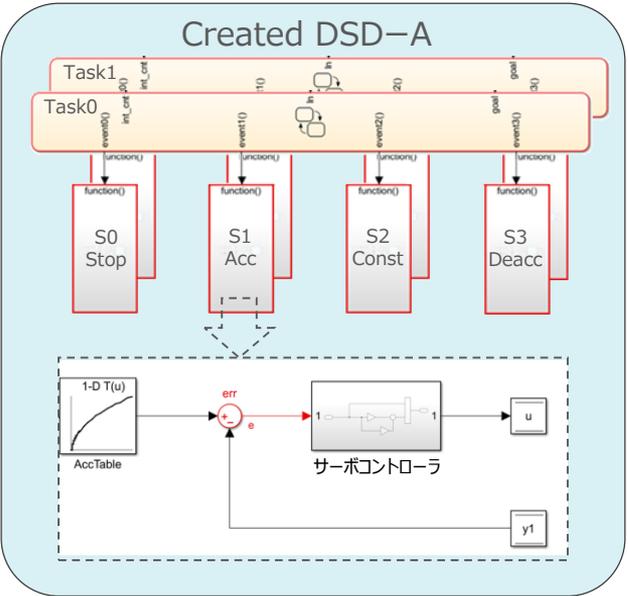

Force scope

Force control Bode diagram

3.9 Code Generation using Embedded Coder and Implementation to MCU

Code Generation

```

/* File: Pattern_private.h
...
/* Code generated for Simulink model "Pattern".
...
/* Model version      : 1.001
/* Simulink Coder version : 8.5 (R2020a) 18-Nov-2019
/* C/C++ source code generated on : Tue Jun 15 19:25:21 2021
...
/* Target selection: ert.tlc
/* Embedded hardware selection: Intel-x86-64 (Windows64)
/* Code generation objectives: Unspecified
/* Validation result: Not run
*/

#ifdef RTW_HEADER_Pattern_private_h_
#define RTW_HEADER_Pattern_private_h_
#include "rtwtypes.h"
#include "zero_crossing_types.h"

/* Imported (extern) states */
extern real_T contact_p; /* "G1"/Data Store Memory10" */
extern real_T Start; /* "G1"/Data Store Memory" */
extern real_T Goal; /* "G1"/Data Store Memory" */
extern real_T flag_a; /* "G1"/Data Store Memory10" */
extern real_T tactile_sensor; /* "G1"/Data Store Memory11" */
extern real_T Deformation; /* "G1"/Data Store Memory13" */
extern real_T Stress; /* "G1"/Data Store Memory14" */
extern real_T Ref; /* "G1"/Data Store Memory15" */
extern real_T Move; /* "G1"/Data Store Memory5" */
extern real_T Movingdistance; /* "G1"/Data Store Memory3" */
extern real_T Qsd; /* "G1"/Data Store Memory4" */
extern real_T Position; /* "G1"/Data Store Memory5" */
extern real_T Velocity; /* "G1"/Data Store Memory5" */
extern real_T u; /* "G1"/Data Store Memory7" */
extern real_T flag_b; /* "G1"/Data Store Memory5" */
extern real_T Integ_value; /* "G1"/Data Store Memory5" */

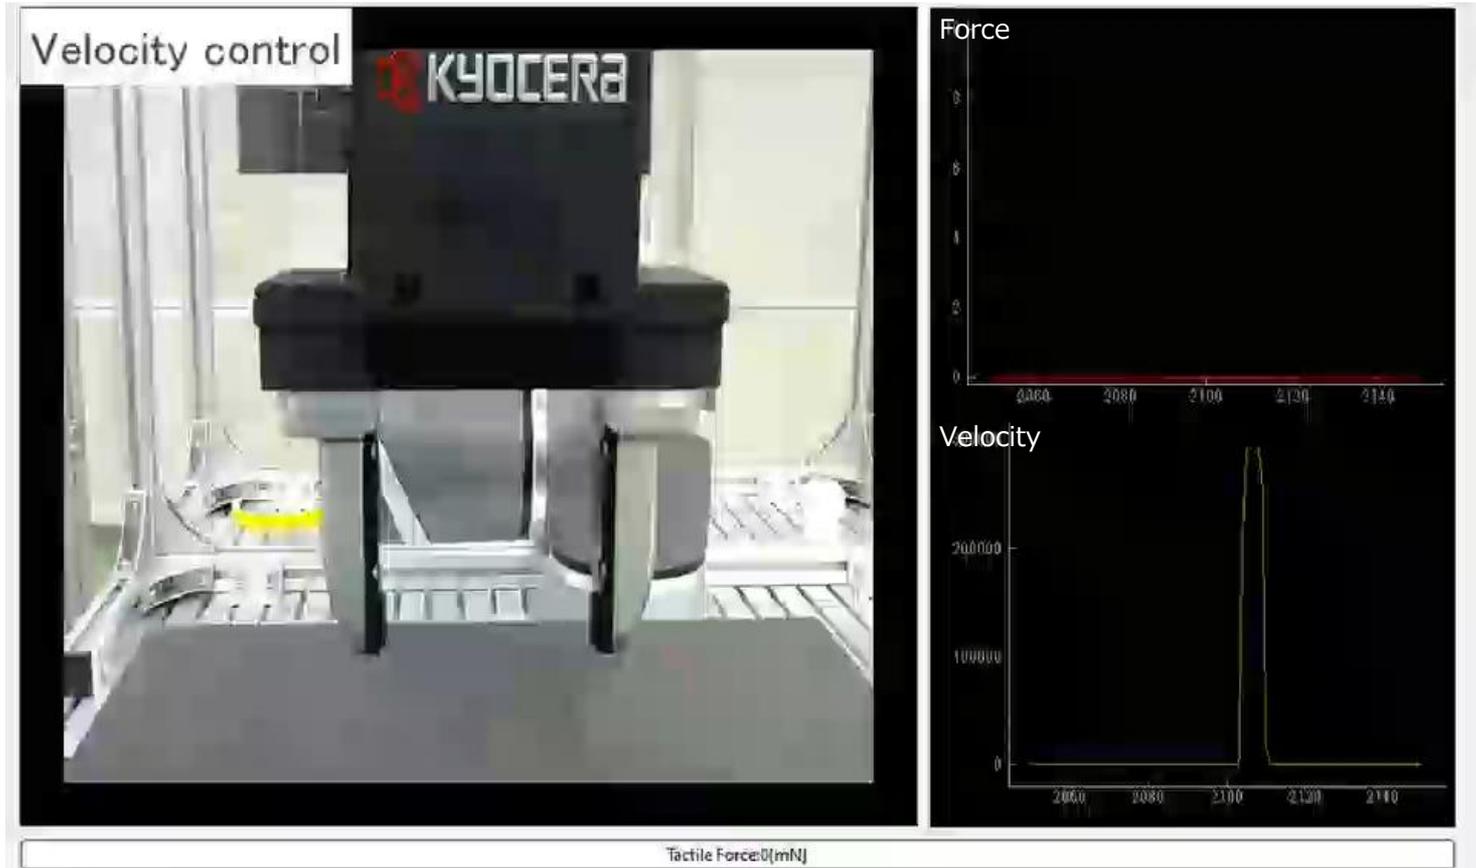

```

Implement

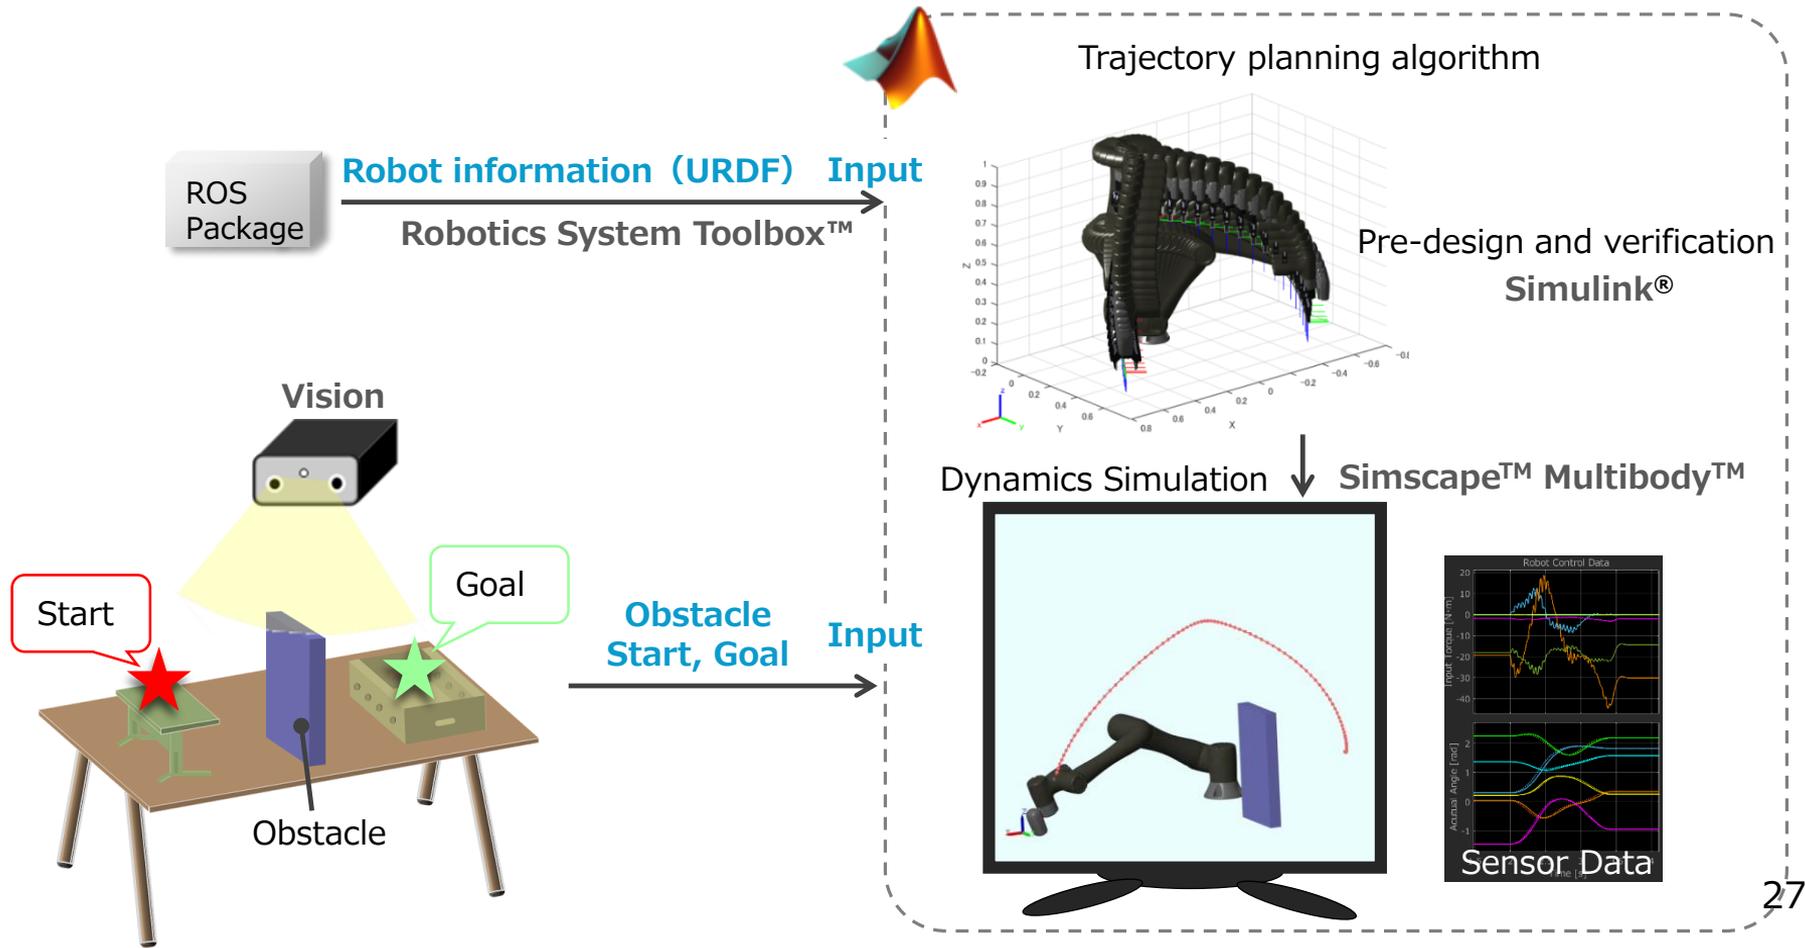

Generated code using MATLAB® Embedded Coder

3.10 Validation on Hardware

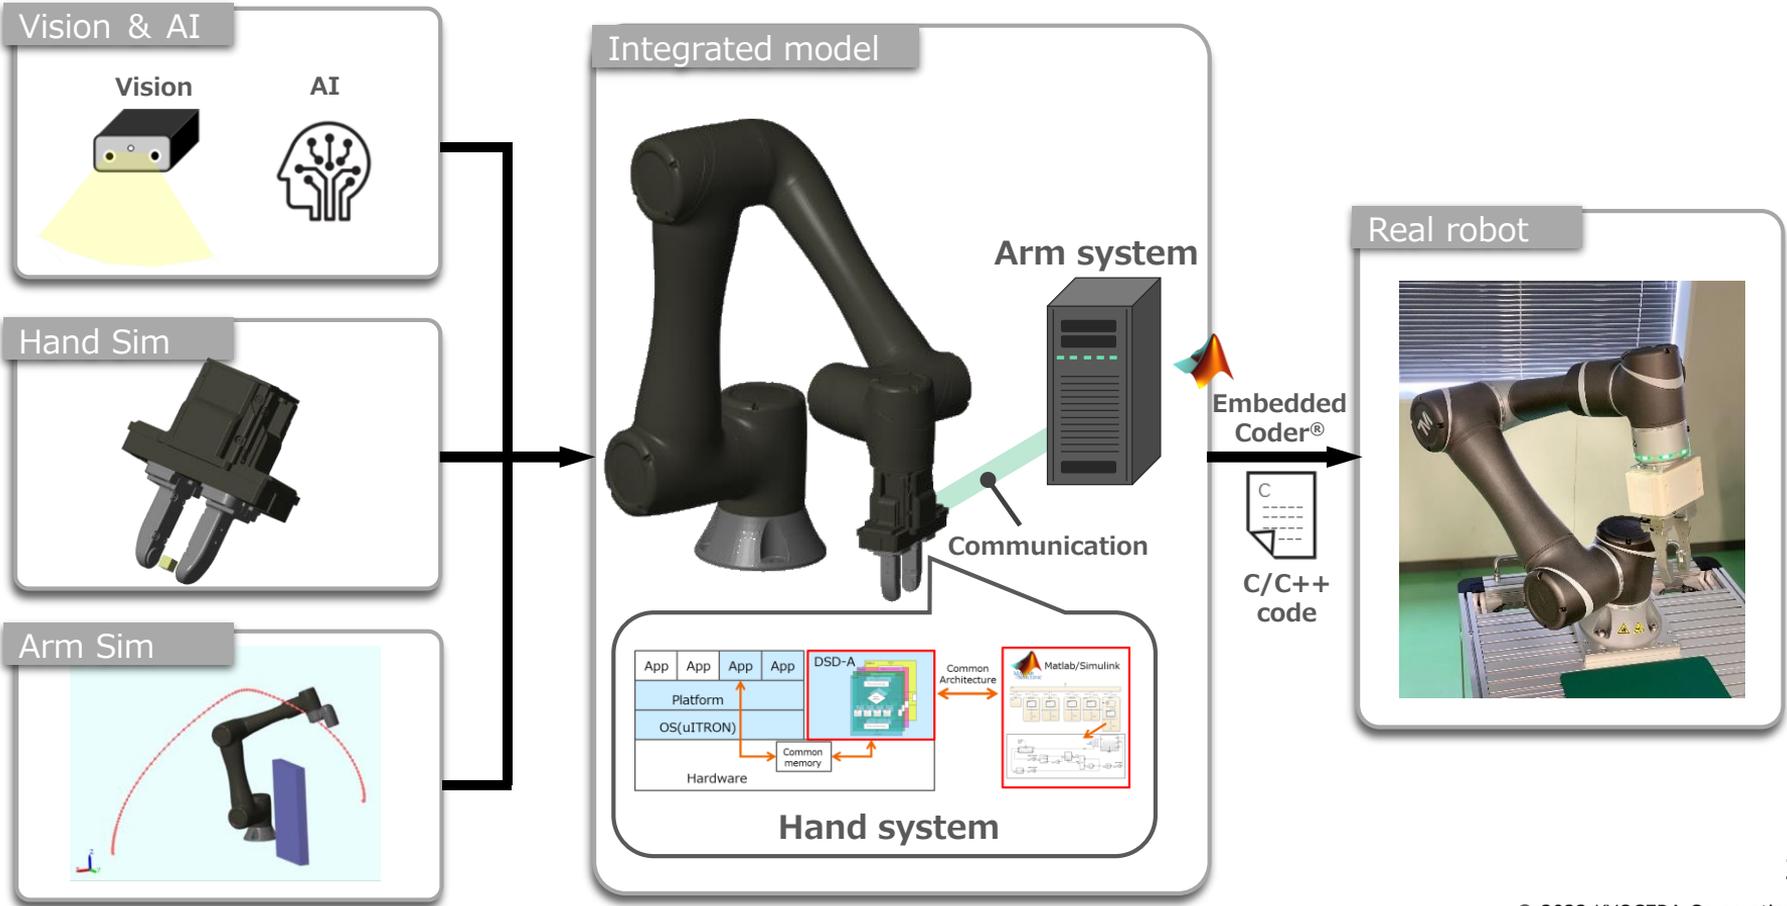

4. Construction of Controllable Multimodal Robot System

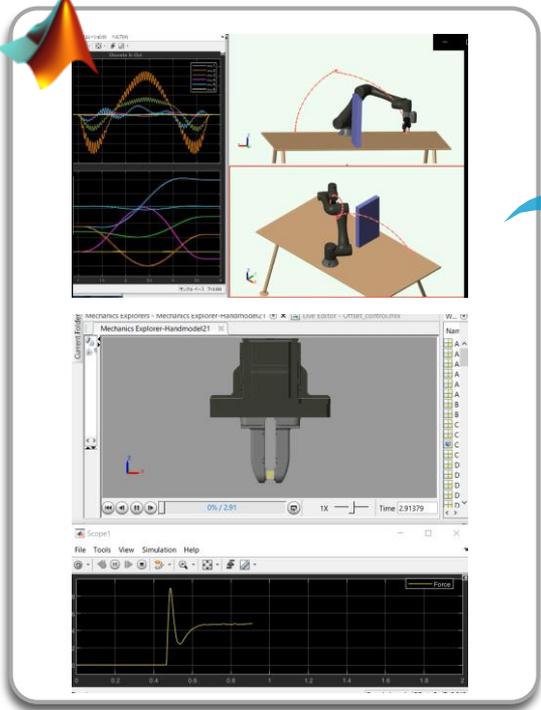

4.1 Overview of Robot-Arm system development

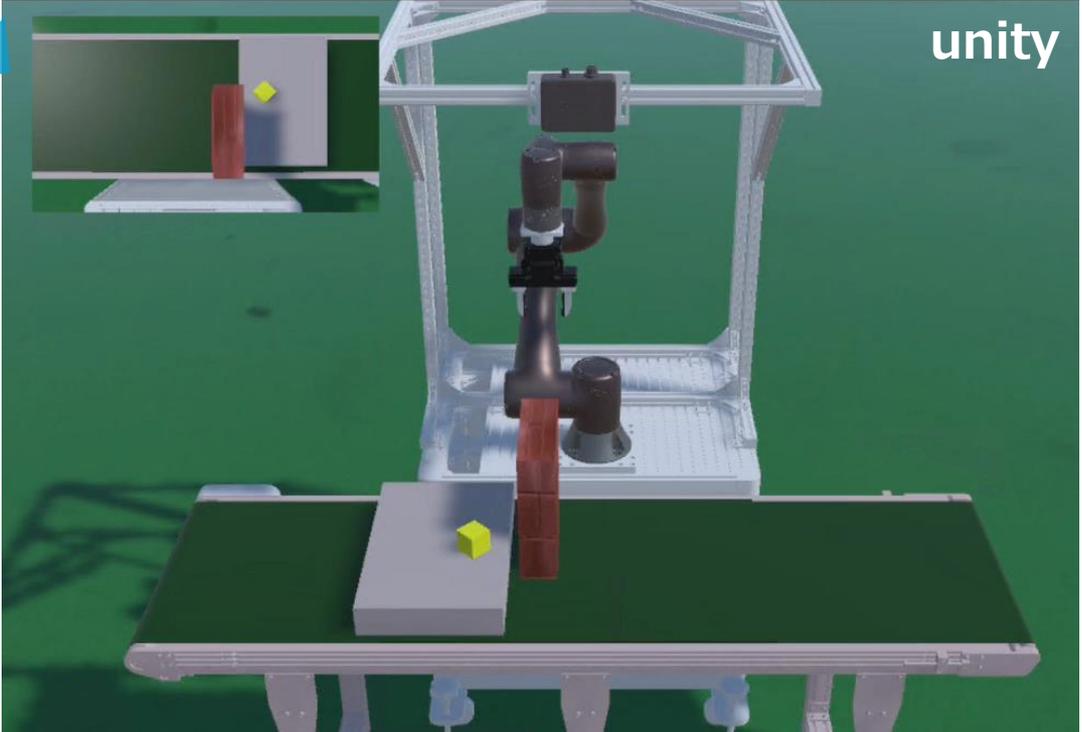

4.2 Integrating Robotic Arm and Hand Model -Construction of Multimodal System-

4.3 Integrating Robotic Arm and Hand Model -Construction of Multimodal System-

Simulation Calculation result

5. Impression and Conclusion

5.1 Impression -MATLAB® used in Robotics-

■ Usability

- + Simulink® UI contains components that enable users (even beginners) to create and build their own system easily
- + Plenty of apps such as *Linearization Manager* and *Model Linearizer* to help users design their control systems
- + Simscape™ Multibody™ visualizes the robot system dynamics and help users troubleshoot control system errors
- + Embedded Coder® allows users to generate C and C++ code automatically to reduce costs and resources in developing software

■ Request

- + Improving performance for complex simulations (e.g. contact forces, multiple sensors, robot complexity, etc.)

⇒ I hope MATLAB® will provide tools to understand tradeoff between performance and precision

5.2 Conclusion

- + We are developing an autonomous collaborative robot capable of multi-modal control based on camera, arm, hand, and various sensor information in order to meet diverse customer needs
- + This session focused on an overview of our development of robot hand with multiple sensors based on MBD. We also introduced SDK and DSD-A design to improve the efficiency in robot hand development.
- + We believe that we can increase the development speed of robot hands by using the proposed development process that combines the SDK and DSD-A for robot hands with the MBD and MATLAB® roots. Hopefully, this problem could lower the difficulty for development in robotics industry.

END
