Example Problem: develop and operationalize a machine learning model to predict failures in industrial pumps

Current system requires Operator to manually monitor operational metrics for anomalies. Their expertise is required to detect and take preventative action.

Develops models

Simulink

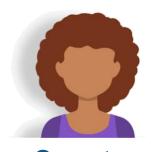

System Architect

Deploys and operationalizes model on Azure cloud

# **Project statement**: develop end-to-end predictive maintenance system and demo in one 3-4 week sprint

Monitor **flow**, **pressure**, and **current** of each pump so I always know their operational state

Need **alert** when fault parameters drift outside an acceptable range so I can take **immediate action** 

Continuous estimate of pump's **remaining useful life (RUL) &** classification → schedule maintenance or replace the asset

### Project statement: constraints & solution

I have few or zero failure data

Generate realistic synthetic data / use Machine Learning models

I have a limited budget, and don't know the adjusted platform

Leverage cloud platform to quickly configure it

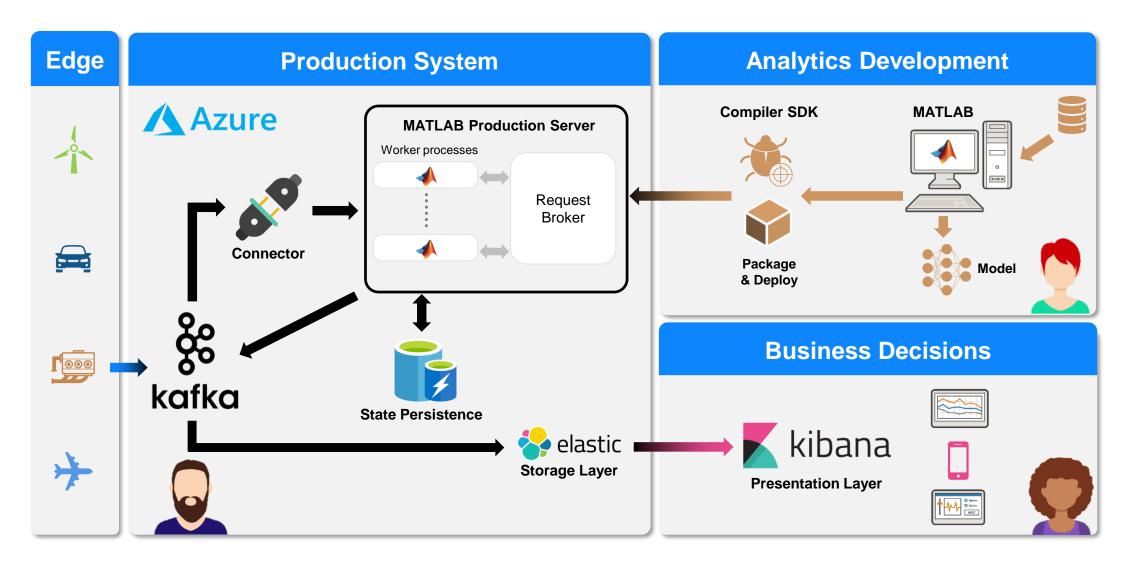

We need multiple tools for multidisciplinary problems

**Process Engineer** 

Use MATLAB and integrate with other environments

#### Baker Hughes Develops Predictive Maintenance Software for Gas and Oil Extraction Equipment Using Data Analytics and Machine Learning

By Gulshan Singh, Engineer Manager

#### Challenge:

Reduce pump equipment costs & downtime

#### Solution:

Use MATLAB to analyze 1 TB of data and create a neural network to predict machine failures

#### Results:

Multiple types of data

We saw three advantages in using MATLAB [...]. The first is **speed**; development in C or other language would have taken longer. The second is **automation**. The third is the wide **variety** of technologies.
